Contract awarded John Pettijohn, Lynchburg, Va.

Proposal

PUBLIC NOTICE

SEALED BIDS will be received by the Board of Education of Hamilton Township, County of Atlantic, State of New Jersey, at 8.00 o'clock P. M. on Friday, October 7, 1927, at a special meeting of the said Board, to be held in the Public School Building, corner of Farragut Avenue and Second Street, May's Landing, New Jersey, for the erection and completion of a three-story Fire-proof High School Building to be erected on the school grounds at the corner of Farragut

Avenue and Second Street in the rear of present frame school house, May's Landing, N. J., according to the plans and specifications on file in the office of S. HUDSON VAUGHN, Architect, Room 642, Guarantee Trust Building, Atlantic City, New Jersey, where said plans and specifications may be seen, or the Architect will loan to prospective bidders a copy of the said plans and specifications on the deposit of \$50.00 by the borrower of the plans, which amount will be returned providing a bid in regular form is submitted to the Board on one of the five groups advertised and the plans and specifications delivered in good condition, to the office of the Architect within one week after bids are opened. Said bids are to be opened and read in Public at the aforesaid time and place.

Five separate bids will be received on five separate groups of the work to be done, together with alternate bids as called for by the specifications.

Construction WorkGroup No. 1
Plumbing WorkGroup No. 2
Electric WorkGroup No. 3
Heating and Ventilating Work.....Group No. 4
Sewage Disposal Work.....Group No. 5

Each bid must be accompanied by a certified check, payable to JAMES F. CANAZZA, Custodian, in the amount of ten percent of the bid, or cash in equal amount.

The certified check or cash, above stated, which accompanies each bid is intended as a guarantee that if the Contract is awarded to the bidder, he will enter into a Contract with said Board of Education, and give Bond, as required by specifications, and if for any reason the successful bidder should fail or refuse to execute the Contract and Bond as required, the certified check or cash accompanying said bid becomes the property of the Board of Education aforesaid and the pro-

ceeds of said check deposited to the credit of said Board.

All checks will be returned within one week after the bids have been opened, excepting the checks of the lowest and next lowest bidder on each section or group of the work.

Surety Company Bond, in the full amount of the Contract, must be furnished by the successful bidder and all bids must be made on "Bidding Proposals" as provided in the specification under Section "A."

If the bidder fails to file with his bid, in addition to his certified check, a proper Consent or Bidder's Bond, executed by officers in authority for said Surety Company, naming the surety that will go on his Bond, the bid will be considered irregular.

Contract will be awarded, if awarded at all, subject to the sale of bonds to finance said work.

The right is reserved to reject any or all bids.

By order of the Board of Education of Hamilton Township, Atlantic County, New Jersey.

ARCHIE H. SMITH,
District Clerk.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

"I DIDN'T KNOW"

is poor consolation to any builder when sudden emergency—fire, wind, etc.—puts his insurance protection to an unexpected test and finds it wanting.

If you do not know that this is a form of insurance featured by the "Old North America" any of our agents will be glad to give you full information and advice on the proper protection you should have, without any obligation.

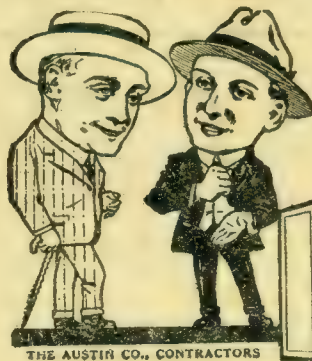

Insurance Company of North America

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

"ANTI-HYDRO" Hardened Concrete Garage Floors Never Wear Out or Need Repairs

THE AUSTIN CO., CONTRACTORS

GARAGE, ROESSLER & HASSLACHER CHEMICAL CO.

Water, oil, wear from chains and other severe conditions encountered in a garage, do not affect the concrete floors when they are hardened and waterproofed with "ANTI-HYDRO."

Because "ANTI-HYDRO" is so easy to use—simply mix it with the gauging water—and because it permanently hardens, waterproofs and oil proofs concrete all in one operation, you will find that its use is a real economy for both you and the owner. It saves more than its cost by eliminating repair bills.

For 23 years "ANTI-HYDRO" has been used by contractors the country over on every type of concrete hardening and waterproofing work. Age is the real proof of permanency. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Residence, Hope Valley, Durham, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Professor H. K. Miller, Jr., care of architect. Frame and brick, wood shingle roof, hardwood floors (plumbing, heating, electric, tile and marble work reserved). Plans in progress.

Residence, Hope Valley, Durham, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, H. E. Snow, care of architect. Brick, stone. Plans in progress. Too early for details.

Residences (4), Twenty-eighth street and Boulevard, Wilmington, Del., \$35,000. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Del. Owners, Peter W. Newell & Son, 801 West Ninth street, Wilmington, Del. Tapestry brick, (2) 3 stories, 30x40 feet, (2) 2 stories, 20x30 feet, oak floors, slag, tin, tile and slate roofs, tile work. Owners will build.

Residences (4), Twenty-sixth street, Wilmington, Del., \$28,000. Architect, private plans. Owners, W. S. and F. J. Boyce, 3314 Madison avenue, Wilmington, Del. Brick, 2 stories, 21x32 feet, slate roof, pine floors, hot water heat, electric light, tile work. Permit issued.

School Building, Mount Storm, West Virginia. Owner, School Board, Mount Storm, West Virginia. Architect, Henry L. Reinhold, Jr., 1632 Walnut street, Phila. Plans in progress.

Miscellaneous Contracts Awarded

Portsmouth Bridge, Sciotoville, Ohio. Architect, private plans. Owners, City of Sciotoville, Ohio. Reinforced concrete cement floors. Contract awarded Golder Const. Co., 263 South Fifteenth street, Philadelphia.

Medical Arts Building, Wilmington, Del. Architects, Peebles & Ferguson, Norfolk, Va. Owners, Technical Building Service Corp., Norfolk, Va. Concrete, brick, steel, 6 stories, 86x52 feet, slag roof, cement and linoleum floors, hollow tile, elevators, roof ventilators, metal weather strip, waterproofing, architectural terra cotta, ornamental iron, bronze doors, kalamein doors, tile and marble, steam heat, electric light. Contract awarded Lee Paschill, American National Bank, Richmond, Va.

Apartment House (add. and alts.), 904

North Adams street, Wilmington, Del., \$3,000. Owner, George S. Charles, 701 Tatnall street, Wilmington, Del. Brick, third story add., 14x33, general alterations, pine floors. Contract awarded George S. Charles & Son, 701 Tatnall street, Wilmington, Del.

QUANTITY—QUALITY—PRICE

By E. J. BRUNNER, Editor, *The American Contractor*

(Address delivered before the Second Annual Meeting of the American Institute of Quantity Surveyors, at Washington, D. C.)

Quantity—Quality—Price is the basis of commerce and of industry. Men toil, delve, fight and sell quantity and quality for a price. The adjustments between quantity and quality on the one hand and price on the other have been going on since the days of Ipus who was the first contractor who executed a lump sum contract as of record.

This man Ipus, so I have discovered, being the first man to do so, was an enterprising individual in the pastoral ages who possessed certain skill in putting up the rude hut required for human beings together with their flocks. Possessing an active mind, he conceived the idea of building for others at a profit.

On his first job, he agreed that the lump sum price should be his taking one of the beautiful wives of his client who was rich in collected pulchritude. He fulfilled the construction expeditiously, not being burdened with plans and specifications or hampered with an architect or architect's superintendent. He made a nice job of it, and then with a club,—probably a relic of the distant stone ages, started out to collect. The story goes that the lady of his choice had little faith in a man who would venture into such a gambling game as building a hut for another, and besides did not like the splinters he left on the built-in bed posts. She was a typical club woman herself and beat him to the clubbing act. Therefore, Ipus drew only a big hard lump on his head for his pains, and ever since that time when that constituted the lump sum payment to Ipus, the ordinary transaction in the construction industry has been called the lump sum contract.

None of the many marvelous inventions of men down through time has been perfect, and so, too, in industrial and economic relationships, no perfect system has been worked out. While progress constantly forges toward apparently more perfect schemes, we still have many relationships which are startlingly illogical even as we see them, and you know in any age the great masses look on the present as being about the last word.

We can well suppose that in the eleventh century, people living under the feudal system thought that conditions

were pretty good. A few thought things might be improved a bit. We think about that same way today and we have reformers, students, and men of action who are not quite so well satisfied who are trying to the common end of bettering labor relationships, taking lost motion and waste out of our distribution system, evaluating the influence of hand to mouth buying, and trying to figure the ultimate significance of the \$10 down an \$5 a week fever which has resulted in an eruption of automobiles, etc.

Consequently, it is quite natural, and not out of line with conditions in all industry, that inspection of the great construction industry with its rapidly growing complexity should reveal some practices which appear to have grown up illogically.

And yet when we trace through their growth, we can see the reason why they have been so moulded as time has gone on. It is through such study that men come to see what changes might be made for the better.

Now let us look to the practice of competitive bidding which has existed since the day when Ipus had a competitor, largely on a lump sum basis, and often with worse effect upon the contractor than was meted out to Ipus.

The essence of fact behind a modern transaction in placing a construction contract on a lump sum basis is that a party commonly called the owner employs either his own or other's services to execute what is commonly called a set of plans and specifications. Through years of experience it has become possible, but shall we go so far as to say probable, that this set of plans and specifications will be so complete and exact that from them trained persons may compute the labor costs and the material costs and by adding to these certain other items such as overhead costs and profits arrive at a contract price to deliver the building broom clean. We can say, gentlemen, that we have arrived at a stage of experience where this can be done.

However, to stick to facts, the plans and specifications are not always perfect, and contractors individually are so tied down in their own interests in maintaining proper relations with architects that they cannot use the proper leverage in most cases to have them made perfect,—the trained men who are the estimators are not always well trained or perfect and sometimes operate in great haste thus increasing their likelihood of not doing their best.

And so we have an essence of fact that today throughout this great country, jobs everywhere are being bid upon by anywhere from two to twenty contractors; and regardless of the fact that no matter which one gets the job, it will take so and

so many brick, just so much mortar, and just so much concrete, you will find that the several bidders on any one job have not except in rare instances arrived at the same quantities to bid upon. The several bidders are bidding on the individual quantities they have set up each for himself, and in the knowledge that all cannot be right. This in the face of the fact that today we have made progress where such a condition would not necessarily have to exist.

And yet when we go into the "why this is so," we find that not so long ago structures were comparatively simple and so were the plans and specifications, providing there were any. In those days, the only thing to do was to gamble on the amounts of materials required. In fact, the cube of the building told the story. There were few materials used and fewer specialties. Materials were fairly cheap. There was no such thing as cost accounting in contracting or in any other business. The grocer, in those days, would "guess out" 5 pounds of 3c sugar. The old cracker barrel was dipped into with a

big scoop on a guess proposition. A bushel of 12c potatoes was not weighed.

It is not strange that in contracting for the erection of a structure which exists only on paper, there should be a holdover from the old conditions where the shrewdest guesser came out best. Neither is it strange that even today there is the feeling among contractors that "my way of estimating" and "my estimating department is more accurate than the other fellow's." Nevertheless, that feeling is the admission that accuracy is not prevalent.

THE EFFECT OF TAKING A CHANCE ON QUANTITY IS THE TAKING A GREATER CHANCE ON PRICE. THE EFFECT OF TAKING A GREATER CHANCE ON PRICE IS PRICE REDUCTION, OR, IN OTHER WORDS, IS THE BASIS OF CUTTHROAT COMPETITION WHERE AND AS IT EXISTS AMONG CONTRACTORS.

For instance, if I am bidding on a 10,000 unit quantity which I feel sure is the right quantity, and know that my

York	500	1,240,074	672	971,516
Total	29,526	\$132,793,241	30,790	\$147,258,808

competitors are bidding on the same quantity, I shall know that the unit price which I set plus the overhead and profit which I will set will be what will determine whether I or someone else gets the job. If I know my unit cost is \$1.00, my bid will be somewhere over \$10,000. I shall feel sure all other bids will be somewhere in the neighborhood of mine.

But if I arrive at the quantity 10,000 units and am not quite sure of it and am reasonably sure that all my competitors have figured different quantities, I cannot take my unit cost of \$1.00 and apply with profit and other items and be sure

that every other bid is going to be within reasonable distance of mine. The fact is, I can feel pretty sure that some poor fellow is going to figure 9,000 units, and then if his unit price is about the same as mine, his bid is going to be \$9,000, plus his added profit and overhead, provided he knows there is such a thing as overhead.

Such is the plight of the contractor today who is in active competition. He has to regard the other fellow's probable gamble on quantity and meet it against his best judgment or lose. Of course, contractors will whenever possible bring

other factors to bear, but all too often the only chance to win a contract is on price.

Now at first this misfortune of the contractor might be thought of as being a boon condition for the owner who will reap the benefit of getting something done for nothing. It is not so because it is against the principle of SELF PRESERVATION FOR ANYONE TO PUT IN QUANTITY AND QUALITY AT A LOSS.

The owner who desires, expects or employs an architect on the assumption of trying to enforce getting more out of a contractor than the contractor is paid for fairly is his worst enemy and seldom profits unless he is shrewd in unloading his building before it has to stand the tests of time.

At first it might be thought that the architect has no direct interest in all this. He has, however, a very direct interest, because when contractors guess on quantities, rather than survey them, a premium is set on incomplete and sketchy plans and specifications. You can guess from them almost as well as from real ones. But given a condition where there is careful checking, the competent architect comes into his own and the incompetent is shown up. An orderly scientific procedure in any industry or affecting any profession or business is directly to the advantage of the business or profession in question.

When quantity is an established fact, then and then only can quality be effectively substituted for price as a basis for bidding.

There is no question in the reasonable mind that quality should be emphasized above price. There is no one connected with the construction industry who is worthy who will not wish for this substitution as promptly as possible. But so long as quantity is gambled with, the substitution of quality for price cannot be made in the wide open field.

Gentlemen, it is not for me to say what will work out of the present situation. Events seem to point out to a steadily growing realization that the establishment of a quantity should precede bidding. Quantity surveying is yet in its infancy, but as is characteristic of healthy infants it is growing rapidly.

The science of quantity surveying will doubtless be a potent factor in rescuing from the present widespread condition of guessing and cutthroat competition which is hurting every man and every interest in the construction industry.

The ultimate rescue will be effected when the building public becomes imbued with the sterling idea that contractors' services should be acquired on the basis of Quantity and Quality backed, of course, by Price.

Type of buildings to be erected according to the permits issued in twenty-seven (27) Pennsylvania cities and boroughs for July, 1927, compared with July, 1926.

Type of Buildings	No.	1927 Estimated Cost	No.	1926 Estimated Cost

American
Fire and Marine
Insurance
Company"*

"I DIDN'T KNOW"

is poor consolation to any builder when sudden emergency—fire, wind etc.—puts his insurance protection to an unexpected test and finds it wanting.

If you do not know that this is a form of insurance featured by the "Old North America" any of our agents will be glad to give you full information and advice on the proper protection you should have, without any obligation.

Insurance Company of North America

write practically every form of Insurance, except life*

"ANTI-HYDRO" Hardened Concrete Garage Floors Never Wear Out or Need Repairs

Water, oil, wear from chains and other severe conditions encountered in a garage, do not affect the concrete floors when they are hardened and waterproofed with "ANTI-HYDRO."

Because "ANTI-HYDRO" is so easy to use—simply mix it with the gauging water—and because it permanently hardens, waterproofs and oil proofs concrete all in one operation, you will find that its use is a real economy for both you and the owner. It saves more than its cost by eliminating repair bills.

For 23 years "ANTI-HYDRO" has been used by contractors the country over on every type of concrete hardening and waterproofing work. Age is the real proof of permanency. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

PHILADELPHIA'S CONTRIBUTION TO HUMANITY

IT is a far cry to the days of old Blockley—the days from 1767 to 1834 when the ancestor of the Philadelphia General Hospital was known as the "Bettering House".

The new group of buildings at thirty-fourth and Pine Streets represents the utmost in modern hospital planning and construction at an initial expenditure of approximately \$4,000,000.

Universal praise is being accorded all those responsible for its existence.

hole which is nearly surrounded by water and has a green of extremely small dimensions. The drive dropped about a foot in front of the pin and bounced into the cup. Mr. George D. Van Sciver, President of the Van Sciver Corporation, Mr. John Barry, a local real estate operator, and Mr. William H. Doubler, a bond broker, completed the foursome. Mr. Coghlan is a member of the Bala Country Club and also of the Penn Athletic Club.

THE PHILADELPHIA GENERAL HOSPITAL

By JOSEPH CHAPMAN DOANE, M. D.

*Medical Director and Superintendent,
Philadelphia General Hospital*

Since 1920, some very important changes have been made at the Philadelphia General Hospital, in Philadelphia.

When the New City Charter became effective, the supervision of the Almshouse was transferred to the Department of Welfare, and it was physically located at Holmesburg. With the addition of new buildings to the plant of the Philadelphia Hospital for Mental Diseases, at Byberry, came the removal of all the committed insane from the grounds of the Philadelphia General Hospital.

These steps are perhaps the most important which have taken place to bring about the existence of a great municipal general hospital in West Philadelphia.

The existence of a general hospital, unencumbered by the presence of the insane and indigent, has been hoped for during many decades.

Perhaps five out of every ten citizens of Philadelphia, if asked where the almshouse is, would reply, "In West Philadelphia." There is need of a great educational campaign, to inform taxpayers of the City, that there is no almshouse in West Philadelphia nor is there an institution for the insane west of the Schuylkill.

The name "Philadelphia General Hospital" is more accurately descriptive now than at any time in the almost two hundred years of its existence. It is a great general hospital, which in size approaches that of any other similar institution in the United States.

The Relocation of the Old Hospital and the Building of the New

With the appropriation of four million dollars, by City Council, for the rebuilding of this old institution, came the need for careful planning, so that a very large institution could be conducted upon the same grounds upon which the new hospital was being built.

After the breaking of ground for the new hospital, which took place with appropriate ceremonies on September 21st, 1925, this relocation of wards and ad-

ministrative departments began in earnest.

Plans and specifications called for the construction of nine buildings, the demolition of the old stone wall surrounding the hospital property, and its replacement by an ornamental brick-and-iron fence.

The buildings, which are now approaching completion, are:

The Men and Women's Medical Buildings,

The Men and Women's Surgical Buildings,

The Administration Building,

The Surgical Clinic,

The Maternity Building,

The Children's Building,

The Nurses' Home.

It is planned to reserve approximately six hundred beds in the old buildings, and to use these structures for the care of chronic patients, not requiring the services of doctors and nurses.

There will be conducted, therefore, on the same grounds an acute hospital, located in the new buildings, and a chronic hospital, for the type of patient described above.

The General Plan of the New Hospital

The general plan, as will be noted from the representation of the Architect's plans which appears in this magazine, is that of a combination of the detached and block scheme of hospital building.

Facing a connecting, central corridor, which is eight hundred and seventy feet long and three stories in height (two stories inclosed and one open), is a great medical and surgical hospital, which consists of two buildings, connected on all floors with each other. These buildings are five stories in height, with a roof garden, and are constructed as outlined above to bring about a flexibility, which avoids the criticism usually justly attached to detached hospital planning.

In these two buildings of ten floors, six could be devoted to the care of men, and four to women, or the reverse, without interfering at all with the conduct of either department, the different sexes being treated in the same building. The general scheme of each floor is as follows:

Each floor, as a rule, consists of one twenty-five-bed ward, two eight-bed wards, one two-bed ward, and two single rooms. On each floor is to be found all the facilities for the care of patients, such as nurses' work-rooms, tray-rooms, dining rooms, class-rooms, visiting physicians' rooms, etc. The arrangement and location of the utilities have been given considerable thought, and it is felt that they have been successfully located to save the steps of nurses and others caring for patients.

The ground floor of these buildings has been given over to the out-patient de-

partments. The location of the corresponding out-patient department in each building is an attempt to co-ordinate the "out" and "in" service.

The Care of Medical Personnel

On the fourth floor of the Women's Medical Building is located a suite for medical personnel who are ill.

The Ex-Resident Association of Blockley Physicians has furnished a suite for members of its association and the Alumnae Association of the School for Nurses is likewise providing furniture for a suite devoted to the care of its members.

Fine facilities have been installed for the treatment of members of the Intern Staff, and the School for Nurses, who become ill during their stay in the institution.

Treatment of Pneumonia Patients

The treatment of pneumonia patients will be carried out on the roof of the Medical Buildings.

General Plan of the Administration Building

In the Administration Building, facilities for the admission of patients are located on the ground floor.

On the first floor is to be found the general offices, including a room for medical records, the social-service department, and the dental laboratories.

On the second floor is an auditorium, seating four hundred and fifty, as well as living quarters for some non-nursing hospital personnel; while on the third floor living quarters of the same type as on the second floor have been placed.

The Surgical-Clinic Building

In the Surgical-Clinic Building are to be found a modern amphitheater for teaching purposes, a central gauze-supply suite, and a most complete X-ray, bronchoscopic and cystoscopic outfit. On the first floor six operating rooms are located, with workers' rooms, storage space, etc.

Summary

Included in these eight buildings therefore are to be found provision for twelve hundred patients, and it is felt that every modern facility has been provided for the scientific care of the sick.

In the past nine years, there have been constructed at Thirty-fourth and Pine Streets the following buildings, which may be said to have been the beginning of the present construction:

A Pathological Laboratory,

A Nurses' Home,

A Power-house,

A Building for the Care of Women Suffering with Tuberculosis,

A Medical Personnel Staff House,

A House for Male and Female Attendants.

The institution, when the present buildings are completed, will house twenty-six hundred patients.

"ANTI-HYDRO" Keeps a Canal Out of this Building

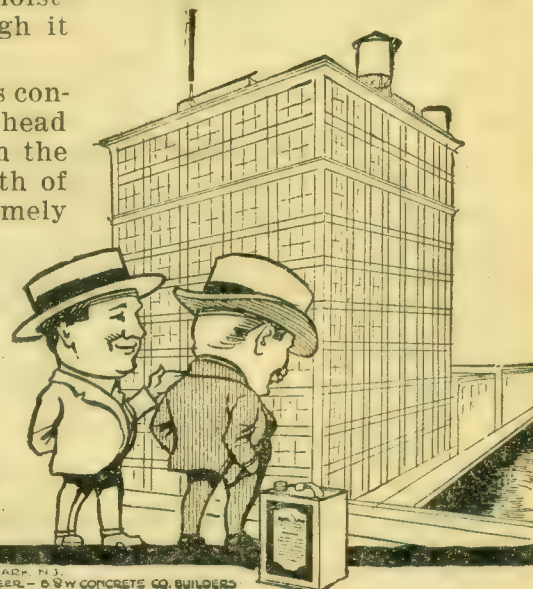

The concrete basement wall is also the canal wall. Water flows continually against the outside, but the inside of the wall is dry as a bone.

This concrete wall was waterproofed with "ANTI-HYDRO" fourteen years ago. Not a drop of moisture has ever penetrated through it during all these years.

"ANTI-HYDRO" waterproofs concrete *permanently* against any head of water. It also increases both the tensile and compressive strength of concrete and makes it extremely hard, all in *one operation*.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. It mixes readily with the gauging water without the aid of skilled labor.

For 23 years "ANTI-HYDRO" has been the accepted standard. Be sure to use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Sinclair & Grigg, Builders, formerly of Medical Arts Building, Philadelphia, have opened new offices at 1518 Walnut Street, Philadelphia.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., September 30, 1927.—Sealed bids will be opened in this office at 3 p. m., October 25, 1927, for changes in the first and second stories in the United States custom house, Philadelphia, Pa. Drawing and specifications may be obtained from custodian of the building, or at this office in the direction of the Supervising Architect, JAS. A. WETMORE, Acting Supervising Architect.

OVERHEAD—A SIMPLE ITEM OF GREAT IMPORTANCE

By GEORGE R. DOYLE, C. P. A., formerly in charge of Accounting Service Department of The National Trade Extension Bureau of Plumbing and Heating Industries, Evansville, Indiana.

Ask any contractor what the parts of a Sale Price are and he will invariably say "Labor, Material and Profit." He completely overlooks another part of the price which is Overhead. The Building Contractor is not alone in this as many others of the building construction trades have the same mistaken idea.

Everybody who is in business, that is who makes or buys, and then resells has an overhead. It does not necessarily take a store, a warehouse or a factory building to produce an overhead.

What is overhead? It is that expense or expenses necessary to carry on the business which cannot be allocated or charged directly to any one job or sale. It consists of such items as rent, tele-

phone, office expense, heat, light, etc. In addition to these items there is the proprietor's salary. This should be included in every building contractor's overhead as separate and distinct from his profit. More in detail concerning this later.

Now let us answer the contractor who says he has no Overhead. His argument is that his business is so small that he does not have any of the expenses mentioned above. He uses his home for his office, consequently he has no light, heat or telephone. He does his own book-keeping, what little is done, therefore no office expense. As for his salary; he gets that out of the profit on the jobs. All of this is his argument on the subject of overhead.

Let us grant him all he says about his business conditions. He uses his house for an office. This necessitates a separate room or possibly only an unsightly desk in the living room. He is perfectly willing to go to this inconvenience, to mar the homelike appearance of his living room for perfect strangers without any recompense. Due to the private nature of his business and to prevent loss of customers through inability to get him on the phone promptly, he has a single line installed instead of the party line that would satisfy the family needs.

Another additional expense given to strangers free of charge. He is compelled to do his office work at night which requires additional light and heat since he would either be in bed or out socially were he not so engaged. So there is another gratuity to the public. He employs no office help; doing his own book-keeping. This he does without charge while the contractor who employs a book-keeper is reimbursed for that expense through his overhead included in the cost of the job. A certain amount of book-keeping has to be done whether paid for to an outsider or performed by the contractor himself. When he is in competition he has that and all other items of overhead to compete with.

Then there are the items of overhead pertaining to the work itself that are overlooked. On rainy days or between jobs; certain good men have to be kept on the pay-roll. It may be only one man that is kept on steady time. That is an item of expense, the lost time, part of the overhead.

Equipment must be kept in repair; it depreciates and parts of it must be replaced from time to time. This item of depreciation is very insidious, it creeps up on one like a thief in the night, it works while we sleep. Today everything is all right; tomorrow something has gone wrong beyond repair and must be replaced immediately. This did not all occur at once but has been going on since the article was first bought. To prepare for this expense a certain proportion of

the cost of the equipment should be added to each job; in the overhead, to provide for its replacement.

There is auto equipment; gasoline, tires, repairs and depreciation. Possibly a driver in addition, for part time at least. In addition to these expenses there are always others of a miscellaneous nature that singly do not amount to much but collectively make quite an item.

Last, but not least, there is the contractor's salary. When a man goes into business for himself he invests two things, his time and his money. The return on the money invested comes in the form of Profit. The return on his time should come as Overhead just as the other expenses do. Were he not supervising the work himself he would be paying a man to do it. In that case he would be well aware of an item of expense there. Doing the work himself does not change the situation. The purchaser should pay for the service just the same. More so, in fact, because he is getting better service from the contractor himself than from an employee. Sometimes the argument is advanced that the business will not afford a salary for the proprietor. It is not necessary that the salary be withdrawn from the business, weekly or monthly, simply take it into consideration when determining the amount and per cent. of Overhead.

There are a great many contractors who recognize the fact that they have an overhead but when they figure a job they lump the overhead and profit together and their percentage of profit is usually not high enough to cover both. Such men have not analyzed their business sufficiently to determine what the overhead is, either in the amount or in proportion to the volume of their business. They merely guess or estimate the percentage to be added and too often this percentage is barely enough for overhead, leaving nothing for profit.

That is why so many contractors go along year after year getting nothing but a living. They make no more than if they were acting as superintendent for some one else. They are being paid for their time but nothing for the risk of the money they have invested. When they suffer a heavy unexpected loss they go broke because their previous profits have not been sufficient to put aside a surplus to take care of such a loss that comes to every business.

Overhead is just as much an item of cost as labor or material. One would not think of figuring the cost of the material in a job and adding the labor and profit in one percentage. It is just as unwise to do that with Overhead. First determine your labor and material costs as closely as possible; to these add a sufficient amount to cover the overhead, then to that total add the percentage to cover

a reasonable profit. By doing this you will know what the total cost of the job is and just how much you can afford to sacrifice, if necessary, without doing the work at a loss. In our next article we will go further into detail as to methods of determining and applying Overhead.—*Building Age and National Builder.*

WHY LANDSCAPE ARCHITECTURE IS ADVISABLE FOR THE REALTOR—BUILDER

Carl R. Frye, landscape architect of Columbus, Ohio, specializing in city planning and subdivision work, proves in many instances, in this interesting article, that his profession is of practical dollars and cents value to the realty developer.

Why should the realtor-builder go to the trouble and expense of consulting a landscape architect in the development of a new real estate project when the ultimate purchasers of the property will eventually surround their homes with shrubbery and trees of their own choosing?

This question was asked me recently by a more or less successful real estate operator whose developments have set a record for sales.

Before I could reply to him, he attempted to answer his own question somewhat in this fashion: "I can take the money that I would use to pay a high salaried landscape architect and use it to buy several ponies or other prizes to be given away in a contest that will attract people to my development, and in the end I will show more sales and a quicker turnover than the fellow who makes use of the landscaping artist."

This gentleman was sincere in his declaration and an examination of his achievements would doubtless show that he was correct in his hypothesis. There

is, no doubt, some value in a balloon ascension or some other form of ballyhoo in the sale of real estate—that is to say, *some real estate*. The type of purchaser who is attracted to a realty development because of a balloon ascension or a pony contest, however, is not the type of person who would expend good hard cash in making the exterior surroundings of his home more pleasant after he purchased it. He is the fellow who is always attempting to get something for nothing—the man who answers the patent medicine advertisements, buys fake oil stocks and rides to the automobile salon in a flivver in order to look over the high-priced cars.

Any realty development that is promoted through such sideshow methods is bound to be just a realty development and nothing more. There will be streets and houses, and streets and houses—nothing beautiful, nothing harmonious, nothing distinctive, and most certainly nothing to attract the purchaser who is tired of the humdrum and commonplace.

So, I might have answered my inquirer's question in this fashion: "If you desire to create a development that is the exact counterpart of 999 other developments that I can point out, use your money to promote pony contests and balloon ascensions. But if it be your purpose to create a residential district that is distinctive, although not necessarily expensive, which will be pointed out as a community of refinement giving your organization the reputation of creative ability rather than that of being an imitator, then the landscape architect should be made a permanent part of your organization. And, above all, if you desire to elevate yourselves above the competitive field of ordinary real estate development, then the proper use of trees and shrubbery is not only necessary but is also essential."

The successful real estate operator is the one who is most conversant with property valuations and their possibilities. It is one of the laws of economics that in order to avoid direct competition one must offer something for sale a little bit better than that of the other fellow. Thus, the first step in overcoming the proposition of competition is to establish a value above that offered by someone else.

Here is where the landscape architect should be consulted. Even before the property is purchased the expert should be asked to consider its practicability for the harmonious planting of flowers, vines and trees. Frequently he will be able to point out cheaper property offering better advantages. The average large scale builder in considering a site for a new development feels that he must have level ground. He visualizes drives and sidewalks, and rows of houses. Uneven land, many times is looked upon as an expensive grading project and unfit for a profitable venture. On the other hand, the landscape architect revels in terrain of this nature which is often to be acquired at a much lower price than the level ground.

For this type of development it is also necessary that a large block of lots, such as adjacent streets or lots facing each other on the same street be acquired. Property should be chosen in a district where there is no definite building line in order to allow for the various types of houses. Full protection must be had against the quick-witted opportunist who is able to realize the possibilities of the project at a glance and step in and buy adjacent property, thereby cashing in on your investment. It is essential that controllable property be acquired.

Co-operation of the building and landscape architects will result in the proper grouping of the houses in order that the

ultimate owners may have the advantage of every inch of space on their properties.

Ground beautification plans can be drawn at the same time the house is being planned, thereby insuring a general scheme of expansive development of rear lawns.

Instead of the stilted row of conventional dwellings aligned like so many ranks of marching soldiers, there will be a community of unusual buildings properly surrounded by trees, shrubbery, gardens, walks and lanes that will be in full harmony with the general scheme as well as with the individual dwellings.

Special attention should be given to the location of the garage which is so essential to the modern home. It is often situated in a most inconvenient place and the unsightly approach usually mars the appearance of what could otherwise be made a beautiful garden in the scheme of development.

Hence with the proper placement of driveways and walks, thought is also given to the garage, so that each section is co-ordinated into one beautiful arrangement of harmony and distinction.

The modern idea of the unique has often resulted in many incongruous combinations of buildings and approaches. French type homes are many times approached by an English flag-stone walk, while an English cottage may be surrounded by some purely American fantasy.

One of the most recent developments in the combination of landscape and building architecture is the private veranda or summer porch in the rear of the house. Back yard privacy is a development for which Mr. Volstead can take credit, and it has been responsible more than anything else for the awakening of the home owner to the possibilities in the rear of his dwelling.

The landscape architect will lay out a grading plan before the work of excavation has begun. The chances are that many of the trees and shrubs can be saved by proper removal and care. Under expert supervision the work of excavation can be made to pay dividends by a careful separation of the top soil, which can later be used to advantage in the grading and landscaping. After construction is completed the architect may proceed with the ground plans in accordance with the original design and it can be readily seen that by calling in a landscape expert before the project is developed, the entire problem of adaptation, location and grouping of the houses can easily be solved at the outset.

Work on the ground development may be carried on during the construction period, and the landscape architect can build up a sales appeal for the grounds while the builder is constructing the at-

tractive dwellings. If the grounds are kept tidy during construction the new home will have as much appeal to the prospective buyer as when completed.

Grading then can be accomplished, walks laid and the drives finished. Such a program will more readily encourage a prospective buyer to inspect the property even before it is completed.

If the planting of shrubs and gardens does not harmonize with the general design of the house it will be an economic loss. Each plant should be able to give a reason for its location.

If it is deemed necessary a planting budget can be fixed by the builder. Then the landscape architect can advise as to the distribution of the expenditures under this budget. His interest is only to reduce the sales resistance on the property and not to reduce a surplus of some plant material in which he is overstocked. If the builder selects a landscape architect who has no allied interests such as nurseries, construction organizations and the like, he will be free to give impartial advice and work to the best interests of his employer.

The future of the large scale builder is dependent upon the quality and durability of his product. If his homes hold up, and if they prove to be worth every cent paid for them with increased value, his reputation is assured. However, they can see the exterior and if the plant selection was such that many died, the picture is more forlorn and unattractive than when the property was new, for it has not the advantage of newness that it had when first built. No builder could afford to take a prospect for a new home to such an unattractive spot.

The prospective home buyer of today usually pays considerable attention to the shrubbery garden.

Trees, shrubbery and flowers break sales resistance for the realty developer in 90 cases out of 100.

A home owner will keep up his interest in the grounds as long as plants grow and develop, but if shrubbery and flowers begin to fade and shrivel in a year or two, he loses interest. He may at first think it is his fault and that he is not properly caring for his gardens, but if he calls in a landscape expert for diagnosis and he finds that there is a lack of proper nourishment in the soil, he will not feel that he has received full value. He will find only that he has a further expenditure to make in addition to his interest payments. A complete replanting and fertilization of the grounds will be necessary.

The landscape architect has exceptional opportunities to develop immediate effects for the builder.

In the past few years the nursery business has progressed so rapidly that many

of them are now specializing. Up until a few years ago if the landscape architect wished to make use of some large sized trees, he was obliged to restrict his selection to a variety which might be indigenous to that section.

This sort of a tree growing wild is usually of a poor shape or has been damaged in some way. Today such nurseries as Amawalk Nursery at Amawalk, N. Y., offers specimen trees in any variety of either deciduous or evergreen specimens and are equipped to ship them any distance with perfect safety.

The landscape architect becomes more than an "expensive luxury" in the planning of a group of homes for the large-scale builder.

Landscape architects are far from being the long-haired dreamers who visualize only beautiful vistas and expensive sunken gardens.

The practical landscape expert is the man who can create a cultural refinement in a community in co-operation with a builder.

This is the sales psychology of the landscape architect and it is based solely upon an inherent trait of human nature. —*Building Age and National Builder.*

WASHINGTON, Oct. 10.—Construction operations, holding to the record-breaking habit acquired during the mid-summer weeks, last month reached the greatest volume ever registered for September of any year, according to statistics compiled by the Associated General Contractors of America. These statistics, based upon shipments of basic construction materials and including all types of construction, also show that only one other month—August of this year—ever rolled up a greater volume.

September's activities enabled the current year to retain the margin it held during recent months over the volume of work carried on during corresponding periods of 1926. The total for the first nine months of 1926 is four per cent. smaller than the total rolled up since the opening of the current year.

The volume of contracts awarded during August was smaller than the total registered for the same month last year, despite the fact that a small increase over the July figure was noted. The August decline was not sufficiently great to place 1927 behind 1926 in the volume of awards during the period covered by the first eight months of the year.

A scale which places the 1913 average at 100 as its basis shows the index number for September's volume of actual operations to be 236. Figures for preceding months are: January, 129; February, 121; March, 135; April, 165; May, 197; June, 212; July, 221, and August, 238.

"ANTI-HYDRO" Keeps a Canal Out of this Building

The concrete basement wall is also the canal wall. Water flows continually against the outside, but the inside of the wall is dry as a bone.

This concrete wall was waterproofed with "ANTI-HYDRO" fourteen years ago. Not a drop of moisture has ever penetrated through it during all these years.

"ANTI-HYDRO" waterproofs concrete *permanently* against any head of water. It also increases both the tensile and compressive strength of concrete and makes it extremely hard, all in *one operation*.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. It mixes readily with the gauging water without the aid of skilled labor.

For 23 years "ANTI-HYDRO" has been the accepted standard. Be sure to use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

PHILLIPPI FOUNTAINS

ICE AND SPACE SAVERS

The "Phillippi" Fountain illustrated is the latest development in cooling and purifying water. Water does not come in contact with ice.

More than one floor can be supplied with ice cold water from a single cabinet.

Descriptive booklet, "Utilizing Nature's Method" sent on request. This booklet illustrates all the various models and their ice capacity.

Our showrooms are for your use, visit them before selecting your plumbing and heating equipment.

Owners, Central Poor District, Retreat, Pa. Brick, steel, concrete, 1 and 2 stories, 97x42 feet, asphalt roof, concrete floors (heating, plumbing, electric, separate), steel sash, laundry equipment, floor hardener. Contract awarded to Nanticoke Const. Co., Nanticoke, Pa.

Residence and Garage, Kingston, Pa. Architects, Knapp & Bosworth, Town Hall Building, Wilkes-Barre, Pa. Owner, W. H. Trethaway, care of architects. Face brick, steel, 3 stories and basement, 31x50 feet, slate roof, hardwood and concrete floors, vapor heat, electric light, tile and marble, art glass, casement windows, ornamental iron work. Contract awarded J. W. Thomas, Wilkes-Barre, Pa.

Buildings, Cressona, Pa. Architect, Clark Dillenback, Twelfth and Market streets, Philadelphia. Owners, Reading Railroad, Twelfth and Market streets, Philadelphia. Brick, reinforced concrete, steel, Barrett specification roof, cement and asphalt floors, plumbing, dampproofing, rolled steel sash, hollow metal doors, bond, ornamental iron work, iron pipe, metal lockers, engine house, 1 story, 115x167 feet, Leanto locker and toilet rooms, 1 story, 37x100 feet, turn table pit, 2 valve pits, 2 inspection pits, foundations for steel water tank, storehouse alterations. Contract awarded I. S. Grindrod, 10 South Eighteenth street, Philadelphia. Turn table, American Bridge Co., Widener Building, Philadelphia. Water tank, Chicago Building & Iron Work, Chicago, Ill.

Residence (alts. and add.), Penlynn, Pa. Architects, Willing, Sims and Talbutt, 126 South Eighteenth street, Philadelphia. Owner, John H. Ingersoll, Penlynn, Pa. Hollow tile, stucco, foame, stone, cut stone, 2½ stories and basement, 40x20 feet, 32x20 feet, shingle roof, cement floors, oak, pine floors, roof ventilators, flagstone, ornamental iron work, limestone, linoleum, metal lath, tile and marble work, bond, iron work. Contract awarded W. D. Lukens, North Wales, Pa.

Residence (alts.), Newtown Square, Pa. Architects, Tilden, Register and Pepper, 1520 Locust street, Philadelphia. Owner, Dr. Alfred Stengel, Newtown Square, Pa. Cinder block, stucco, 2½ stories and basement, hot water heat, electric light, metal lath, tile work, plumbing, shingle roof, carpentry and hill work, plastering, painting, glazing. Contract awarded Townsend, Schroeder & Wood, Drexel Building, Philadelphia.

Nurses' Home (add. and alts.), Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Sacred Heart Hospital, 421 Chew street, Allentown, Pa. Brick, steel, concrete, 4 stories, 38x108 feet, built-up roof, concrete floors, hollow tile, elevators, safety treads, metal lath, tile, marble, terrazzo, steel sash, ka'mein doors, waterproofing and dampproofing, stone trim. Contract awarded Ochs Const. Co., 440 Wire street, Allentown, Pa.

Garage and Show Room, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Klein Motor Co., 12 North Eleventh street, Allentown, Pa. Brick, steel, 2 stories, 86x128 feet, slag roof, concrete and tile floors, hollow tile, elevators, roof ventilators, tile, ornamental iron,

waterproofing, fire doors, steel sash. Contract awarded to Butz & Clader, 519 Hamilton street, Allentown, Pa.

School, Penn avenue, Scranton, Pa. Architect, P. J. Morris, Mears Building, Scranton, Pa. Owners, St. Paul's Roman Catholic Church, Rev. J. V. Hussie, 1510 Penn avenue, Scranton, Pa. Brick, cinder block, 3 stories, 93x137 feet, Barrett roof, composition roof, safety treads, roof ventilators, damp-proofing, waterproofing, skylights (heating, plumbing and electric separate. Contract awarded Central Const. Co., Harrisburg, Pa.

Bank, Simpson, Pa. Architect, D. H. Morgan, Connell Building, Scranton, Pa. Owners, Simpson State Bank, Mr. Norton, Simpson, Pa. Stone, 1 story, 36x60 feet, slate roof, linoleum, marble floors, metal window guards, bronze, casement windows, ornamental iron, steel skylights, tile and marble, steam heat, electric. Contract awarded to William Perry, 314 Oakford Court, Scranton, Pa.

Hospital and Boiler House, Kingston, Pa. Architects, McCormick & French, Second National Bank Building, Wilkes-Barre, Pa. Owners, Nesbitt West Side Hospital, Dr. A. W. Grover, 293 North Maple street, Kingston, Pa. Brick, 3 stories, tile and marble, marble and cork floors, metal lath, steam heat, electric light. Contract awarded to John Curtis & Co., Hill and Hickory streets, Wilkes-Barre, Pa.

School, Mill Creek, Bucks County, Pa. Architect, A. Oscar Martin, Doylestown, Pa. Owners, School Board of Wallington Township, Pa. Contract awarded D. D. Nye, Doylestown, Pa., \$12,364. Bids on mechanical equipment will be taken in a month.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Delaware County, R-420, A-4943, Upper Darby and Darby Townships, Clifton Heights, Aldan, Folcroft, Collingdale and Glenolden Boroughs. One course reinforced concrete. Contract awarded William Eisenberg, Smith-Austermuhl Building, Camden, N. J., \$135,753.16.

Indiana County, R-67, Sec. 1, White and Armstrong Townships. One course reinforced concrete. Contract awarded M. Bennett & Sons, Indiana, Pa., \$256,857.45.

Eighth Street Relief Sewer, Chester, Pa. Engineer, Robert C. Wheeler, Albany, N. Y. Owners, City of Chester, Bureau of Highways, Chester, Pa. Contract awarded Pennsylvania Paving Co., Chester, Pa., \$50,489.54.

SPECIAL NOTICE

The Sixth Annual Convention of the American Construction Council will be held in St. Louis, Mo., at the Hotel Statler, December 1st and 3rd inclusive.

The plans under way for this convention promise the greatest meeting the Council has yet held.

EFFLORESCENCE ON BRICK WALLS

Since the days of the third Napoleon, the problem of efflorescence on brick walls has been under consideration, and for a long time, as Mark Twain said of the weather, "Everybody talked about it, but nobody did anything about it." Later the chief activity seems to have consisted of taking sides in a controversy as to whether the brick itself or the mortar used was to blame.

As a matter of fact, the materials causing efflorescence may occur in the mortar, in the mortar color, in anti-freezing mixtures, in the soil, in water, in concrete used for foundations, floors, steps, coping, caps, sills, etc., in the soot that accumulates on roofs and possibly, to a limited extent, in the brick itself. Backing up brick and tile made of other materials than burned clay are a prolific source of efflorescence.

The materials causing efflorescence may be any one or more of the following: sulphates, chlorides, carbonates and nitrates of calcium, sodium, potassium, magnesium and iron, and others, no doubt. But whatever the material, the presence and evaporation of moisture is an essential factor.

Development in the art of brickmaking is such that there is little opportunity for efflorescence to develop from within the brick itself. In the first place, there is careful selection of raw materials to eliminate harmful elements and every effort is made to prevent their intrusion. If necessary, chemicals are introduced to convert soluble materials into insoluble forms. Finally burning is carried to such an extent that fusion of any harmful ingredients present results.

It is equally important that the same care and precaution be used in the fabrication of the completed wall and in its subsequent treatment. It must be borne in mind that ordinary mortar is made up largely of lime, with more or less magnesium, and that the more soluble salts may be introduced with the sand and

mixing water. Red mortar color, particularly, contains iron sulphate. Portland cement concrete and mortar are in a state of continual change and in the presence of moisture, free lime is formed. Soil and soil waters contain lime and other salts. In the presence of moisture any of these deleterious materials may be brought to the wall surface by capillary movement and be deposited thereon as the result of evaporation.

Water must be employed in the fabrication of concrete and in the preparation of all kinds of mortar. A moderate amount of initial efflorescence, therefore, well may be expected, but is of little concern. Subsequent appearance of efflorescence may occur also if proper methods of design and construction have not been followed or if improper practices are involved. Such subsequent appearance is of more importance and may become more or less permanent.

Much of the difficulty may be avoided if due precautions are used. Especial care should be exercised in the selection of materials, particularly sand, gravel and water to be used in making mortar or concrete, to make sure that they are as free as possible from deleterious substances.

Attention should be given also to the arrangement and protection of the various elements of the wall and to subsequent treatment of the wall and its appurtenances.

If concrete foundations are used, a strip of heavy asphaltic roofing should be placed between the foundation and the brick wall.

All concrete sills and caps and coping should be provided with proper drips.

Foundations of all kinds and retaining walls should be water-proofed on the soil side with an approved asphaltic compound.

Portland cement mortar should be used for all walls making contact with the soil or in a position where water from sprays or eaves drips may reach them. Elsewhere, low magnesium mortars are preferable to high magnesium mortars.

Roofs must be designed and constructed so that no water may reach the walls.

Eaves troughs and downspouts must be properly designed and constructed and be kept in repair.

Sprays should not be permitted to play directly against walls, and care should be used in the process of scrubbing porches and steps. In connection with the latter there is danger not only with respect to the water itself, but because of the soap or washing compound used.

Efflorescence mars the appearance of a brick wall and may result in distintegration of the mortar and even of the surface of rough textured brick.—*Associated Contractor.*

SOUNDPROOFING OF APARTMENT HOUSES*

With the increasing number of apartment houses and office buildings and the consequent concentration of human activities in close proximity, the problem of sound insulation is rapidly becoming one of the first magnitude. In the construction of such buildings increasing attention is being given to the choice of materials and to the type of construction which may be expected to give a satisfactory degree of sound insulation. Until the last few years there has been but little information available on this subject, but recently several laboratories in this country and abroad have given systematic study to the conditions underlying this problem. Among these laboratories the Bureau of Standards is included.

About four years ago the Bureau of Standards constructed a special building for the purpose of making tests of the acoustic properties of building materials, and since then it has tested a large number of partition walls of the types commonly used in building construction. At the present time attention is being directed to various types of masonry walls and floors. It has been gratifying to find that several associations representing the building trades have considered it worth while to co-operate in this program of experimental work. Such co-operation has been available from the Gypsum Industries (Inc.), the National Lime Association, and the Hollow Building Tile Association.

To form a clear idea of the problem of sound insulation it is necessary to consider how the air vibrations which constitute sound waves are transmitted through a partition wall from one room or space to another.

Sound waves in air consist of alternate compressions and rarefactions, and if there are no holes or cracks in the wall to provide an air path along which the waves can pass directly from one side to the other, the only mode of transmission is by setting the wall itself in vibration. The wall yields a very little to the pressure of each sound wave that strikes it, so that it is thrown into a corresponding state of vibration; and the vibrating wall, in turn, sets the air on the other side in motion, just as the diaphragm of a telephone receiver or of a loudspeaker set up sound waves which are then propagated through the air to the listener's ear.

A solid wall or a smaller panel, such as a wooden door, thus acts like a more or less elastic diaphragm held at the edges; and it is obvious that the less the wall moves back and forth in response to the

sound waves falling on one side of it, the fainter will be the sounds set up on the other side. Hence, making the wall stiffer or heavier, or both, makes it a better sound insulator.

The behavior of compound walls containing inclosed air spaces is not quite so simple, and as an important practical case we may consider the common lath-and-plaster partition supported on studs.

Each face of such a wall consists mainly of a series of rather light and flexible panels, held more or less rigidly at their edges by the studs. The two surfaces are separated by an air space except at the studs, where there is a rigid cross connection which ties the two surfaces together and at these points forces them to move back and forth simultaneously, if at all. Under the alternating pressure impulses of sound waves the studs yield a little and the wall may vibrate as a whole, but each of the more flexible panels may also vibrate separately, its center moving more than its edges, and we may consider what happens to the middle of the panel, disregarding the motion of its edges, for the present.

The surface toward the source of sound is thrown into vibration, and this sets up corresponding sound waves in the dead air space. These throw the second surface into vibration, and so, finally, sound waves are set up in the air on the farther side of the wall. A simpler way to look at it is that the inclosed air acts like an elastic crosstie between the two layers of lath and plaster, but this connection is so weak that the motion of the second surface is very much less than that of the first. The connection is very ineffective, the transmission is low, and the air space is a good insulator.

But if a rigid cross connection is established in the middle of the panel the two surfaces are obliged to move together; and while the first surface is prevented from moving so much, the second moves very much more, and the net result is that the transmission is increased. Thus, while a single strut or crosstie does not constrain the whole panel, the insulating value of the air space is very much reduced.

If we consider any two adjacent panels together, we may evidently regard the intermediate stud as constituting a rigid crosstie in the middle of a double panel. And although the stiffness and weight of the stud prevent the motion from being as great as if the surfaces were merely connected by a light strip of wood not fastened at the ends, measurements made at the Bureau of Standards show that the transmission of sound through a lath-and-plaster wall does occur mainly at the studs and only to a minor extent across the intervening air spaces.

It is evident from the foregoing that cross connections may be very detrimental.

*By V. L. Chrisler, associate physicist, Bureau of Standards. Technologic Paper No. 337.

al to the sound insulating value of a lath-and-plaster wall.

Materials which are fairly good heat insulators are often introduced into this air space, as it has generally been claimed that these materials also improve the sound insulation. The effect of such a filler depends on circumstances. The filler may absorb sound, but it also forms a solid connection between the two surfaces, the connection being more or less soft or rigid according to the material. Moreover, the filler adds to the weight of the wall, and this in itself tends to decrease the vibration of the wall as a whole and to improve the insulation.

The net result could not be predicted, but from the results obtained at the Bureau of Standards it appears that such a filling material is of doubtful value. Although it has been a common assumption with builders that good heat-insulating materials are likewise good sound insulators, experiment does not bear this out in all cases. An air space is generally better than a filling material. In the experiments with stud walls at the Bureau of Standards the introduction of various filling materials into the air space between the studs resulted in nearly every case in a slight increase in the transmission of sound.

These measurements illustrate, also, another point—that weight is not the only factor which determines the sound-insulating property of a wall. For the heaviest heat-insulating material used the sound transmission of the wall was about the same after the wall was filled as before, although the weight of the wall was about doubled, while for the lighter materials, with one exception the transmission was slightly increased, although the weight had been increased some 50 per cent.

Paul Sabine** gives the results of experiments carried out at the Riverbank Laboratories in which he found that either slag or sawdust used as a filler materially reduced the sound insulation of a double partition. The air space in the panels he used was 3 by 8 feet, but the same effect is to be expected in a space 16 inches by 8 feet the ordinary dimensions of the section between studs in a partition wall.

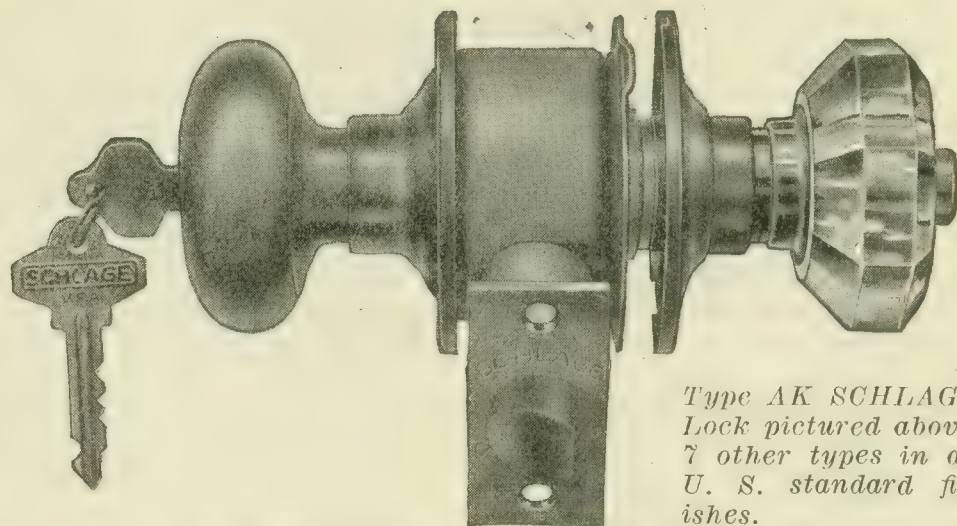

In other experiments made at the Bureau of Standards walls were constructed of two solid plaster partitions with an air space occupying the whole area between them. Measurements were taken with the space empty, and also when this space was loosely filled with hair felt, Celotex, and Cabot's Quilt. It was found that although there was but little difference

in the amount of sound transmitted in the four cases,** the transmission did depend largely upon the manner in which the panels were supported at the edges. For instance, considerably less sound passed through the double panels when they were supported on felt pads than when supported on a piece of wood which acted as a tie between the two partitions.

Experiment, then, leads to these conclusions: First, that to obtain a wall which has the greatest sound-insulating power the two surfaces should not be tied together; and, secondly, that most fillers are valueless or even detrimental as far as sound transmission is concerned, because they act as a tie between the two

surfaces. The separation of the surfaces can be accomplished in a masonry wall, where the partition does not carry a load, by building two walls of 3 or 4 inch material with an intervening air space. In a stud wall this can be done by staggering the studs, so that the opposite sides are independently supported. There is a system which has been worked out and used with success by which the weight of the wall surfaces is carried on felt pads. This undoubtedly has some effect in reducing the transmission, although no measurements have been made at the Bureau of Standards on this particular construction.

In old apartment houses there is some-

the MODERN lock for MODERN buildings

A factory-assembled unit-type compression-spring door lock for the price of an unassembled lock. Installed in 1/3 of the time required for other locks. Simply drill 2 holes. No screws in spindle, knobs or escutcheons. No complicated mortising. No adjusting. Does away with inside keys. Just press the button in the knob to lock inside, just turn the knob to unlock. Over three-quarters of a million already sold. No building modern without them. Complete catalog and price list on request.

**The Armour Engineer, May, 1926.

***Paul Sabine found similar results with hair felt. The Armour Engineer, May, 1926.

times a door in the partition between adjoining apartments. This is often a source of annoyance, as the door transmits considerably more sound than the partition.

The defect can be overcome by the use of an auxiliary panel constructed of layers of hair felt between gypsum wall board or Celotex.**** This auxiliary partition should fit closely in the casing of the door. Gypsum board is more fire resistant than Celotex and slightly more opaque to sound. Whole partitions may be treated in this manner, but in such cases it would be better to build a secondary wall, leaving an inch of air space between it and the original partition.

Another source of annoyance is noise in corridors. As corridors are generally built, especially in fireproof structures, the wall surfaces are excellent reflectors of sound. The best of silvered mirrors reflects only 93 per cent. of light, while a plastered wall finished with a white coat or a hard sand finish reflects from 97 to 99 per cent. of the sound energy. If these surfaces were finished with a plaster which would absorb from 10 to 30 per cent. of the sound energy striking it, the corridor noises would be greatly reduced. There are two or three such plasters on the market. It is not only logical but cheaper to use such material in the original construction of a corridor or auditorium rather than to attempt to correct the trouble after building has been completed.

A sound-absorbing plaster is not necessary for the rooms in an apartment, as the rugs, draperies, furniture, etc., furnish enough absorbing material. In offices, however, when furnished very plainly, such a plaster is desirable to eliminate excessive reverberation.

We have so far dealt only with noises which are communicated to the walls or floors by the air. In the case of noise made by machinery, or by anyone walking across the floor, the problem is of a somewhat different nature. For machinery the only solution is to support the machine on pads, which prevent the vibrations being transferred from the machine to the framework of the building. Various materials, such as cork, hair felt, or other similar materials, have been used for this purpose with varying degrees of success. Great care must also be taken to insulate the holding-down bolts from the machine or building with similar pads, otherwise the vibration would be carried directly to the building, and the pads between the machine and the building would be of no value. In this connection reference may be made

****Gypsum Wallboard and Celotex are mentioned as laboratory tests have been made on these materials. It is probable that some of the other wallboards are equally satisfactory.

to the work of Prof. F. R. Watson, of the University of Illinois.

Floor noises—that is, noises caused by a person walking, dragging a chair across the floor, etc.—can be reduced in somewhat the same manner. In this case either the whole of the finished floor must be supported on pads or cork or rubber tile, or a heavy carpet used on top of the floor, or it is possible to build a suspended ceiling which is insulated from the floor above. By any of these methods the vibrations are to a great extent prevented from reaching the ceiling of the room below. Though several methods have been worked out to reduce noises transmitted in this manner, there have been, as far as the writer knows, no published comparative tests of such systems.

This article must not be taken as a detailed description of how to construct successfully a "soundproof apartment house" but simply as suggesting how improvements to this end may be made. In the successful application of these suggestions the experience and ingenuity of the builder will be a large factor.—*Architecture and Building*.

WINTER BUILDING IS TONIC TO TRADE, SAYS EXECUTIVE

Projects Planned for 1927-28 Season Indicate Rout of Cold Weather Construction Slump

Building and allied trades cease to suffer from winter slump as the popular winter building bogey is routed, says George E. Warren, assistant general manager of the Portland Cement Association.

"Wise builders are planning now for construction straight through the cold weather season. Use of twelve months in the year instead of eight or nine months eliminates the loss from seasonal depression that has been so costly to industry."

Construction engineers agree that building in winter is not only practical but highly desirable from the owner's point of view as well as the worker's. Structurally, building operations can go on through cold weather without any risk if ordinary precautions are taken, it is stated.

Employment during the winter months means that the economic stability of business will be maintained, Warren points out. Not only men employed on construction work but those supplying building materials and engaged in the many lines touched by construction are able to retain their standards of living.

"Maintenance of these standards, and with them buying power, is reflected automatically in the marts of trade. Healthy activity in a five billion dollar industry is stimulated to all others."

Building statistics for the past few years reveal that more and more

buildings are being financed and built during the winter months. In sixteen cities surveyed payrolls and material purchases have mounted each year. Indications are, according to contractors, that the winter of 1927-28 will eclipse any previous winter period.

CONDITIONS IN THE COMMON BRICK INDUSTRY

Prepared by the Common Brick Manufacturers' Association of America

The value of clay products manufactured in the United States in 1926 was \$459,049,470, according to a report of the Department of Commerce. This amount shows a gain of 2 6/10 per cent. over the value of clay products marketed in 1925, and 5 2/10 per cent. gain over 1924.

Of the clay products manufactured for building purposes, being common brick, face brick and hollow tile, common brick makes the best showing in the 1926 report. With fifty-three fewer plants reporting, the value of common brick produced in 1926 was three-tenths of one per cent less than in 1925, and is approximately 2 per cent. greater than the value of common brick in 1924.

It is interesting to note that the number of plants reporting in 1926 is 1220, and with the thorough methods of the Census Bureau it may be assumed that very few plants were missed in the investigation. The Geological survey of twenty years ago shows the report of approximately 5000 plants making common brick. The loss of something like 4000 institutions in this industry is the result of destructive competition and failure on the part of the brick manufacturers to couple merchandising with production. The industry, however, is becoming stabilized and there no doubt will be further reduction in the number of plants with an increase in production and consumption of common brick.

As against three and one half billion common brick consumed in 1918 there was consumed more than seven and a half billion in 1926. This is a gain of more than 100 per cent. The gain of the members of the Common Brick Association exceeds even this figure showing that the non-cooperating manufacturers are absorbing all the loss while organized manufacturers, by the use of Association merchandising methods, are cashing in on the national advertising campaign for common brick with a gain of approximately 12 per cent. a year during the past four years.

Throughout the country there is a slight lull in building operations at the present time. This is believed to be only temporary and there apparently is no fundamental reason for a serious letting down of construction volume.

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

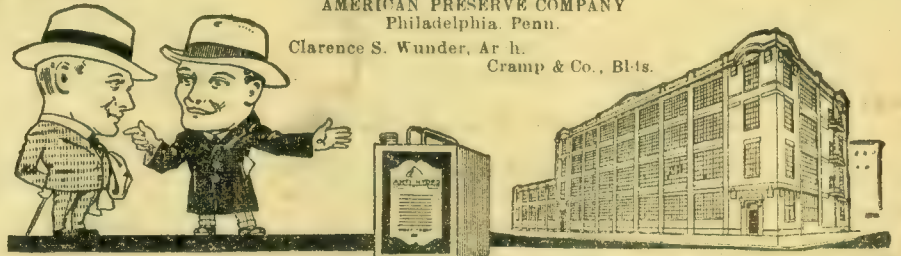

The concrete floor in the basement of this building is constantly
subjected to the severe conditions peculiar to this industry. Yet
"ANTI-HYDRO" has so thoroughly and permanently hardened
the concrete that it is unaffected by acids, oil, water and wear.

"ANTI-HYDRO" is extremely easy and economical to use. Being
a liquid, it mixes readily with the gauging water and through the
concrete, insuring uniform strength and hardness to the concrete.
It accelerates the set of cement, increases its strength and so
enriches it that much of the finishers' time is saved and overtime
work is eliminated.

For 23 years "ANTI-HYDRO" has been the accepted standard.
Results are always permanent and results are what count. Use it
on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

TALL BUILDINGS AID CITY GROWTH

*Commissioner George Henry Payne
Defends Skyscraper Against
Attack*

Considerable interest has been evoked in New York by the article on the Skyscraper written by George Henry Payne, Commissioner of Taxes and Assessments, New York City, President of the Committee of American Business Men, and author of the History of Journalism.

Commissioner Payne considers the skyscraper as one of the glories of America, and is opposed to the plans that some civic bodies in the East are now urging.

The Commissioner writes:—

Somewhere Viscount Morley, one of the most profound of modern thinkers, has stated that a difficulty with most politicians is that when discussing one subject they are generally thinking of something else. The type is familiar but is not confined to politicians. Many of those who today are denouncing the skyscraper are really using it only as a means for condemning traffic conditions that are not traceable to tall buildings but to our own neglect in providing for increased population.

No one will deny the noble impulses of the highly indignant old gentleman who rushed up to a stranger walking along with a little boy with a bleeding

nose and denounced him for beating his son. Unfortunately the child was not the son of the man who had him in charge nor had he been beaten and the reluctant boy who had bumped his face on the sidewalk was being dragged to a drug store for the purpose of administering, not castigation, but courtplaster.

Is it not time that someone did something to save the skyscraper? Not one single word would any one say against the integrity and the high-mindedness of those who wish to remedy the problem of congestion or who wish to make this City more livable, but is not the skyscraper being blamed for ills for which it is not responsible?

If it were possible to remedy the mistakes that would be made if those who are against the skyscraper had their way, one might view their activities as harmless, with the knowledge that time, after all, rectifies all things and that nature and progress work out to logical laws, even for illogical men. But unfortunately, if illogical laws are made, that restrict and bind a great City, generation after generation suffers, and in some cases, restrictive laws brought about by perfectly honest or misguided efforts become almost irrevocable.

Probably nothing is more unjust or more illogical than to blame the skyscraper for congestion. Becker in his "Gallus" shows us the impossible traffic conditions in Rome in the first century A. D. when funeral processions would clash with vegetable peddlers, and this has been the story of almost every great city and was the story of New York long before the skyscraper came. Old engravings of Fulton Street and Broadway in the pre-Civil War days show a traffic condition absolutely intolerable according to modern theories of movement.

It is as wrong to stop the building of skyscrapers, with reasonable restrictions, as it would be to regulate the number of people who should live in the City or who should work in it. It is not the building in New York that has produced traffic congestions; it is the character of modern traffic. Science has produced, in absolutely extraordinary numbers in twenty-five years an undreamt of type of vehicle within the means of the poorest people. How unfair it is to blame the skyscrapers for traffic congestion is shown by the fact that the greatest traffic is on Fifth Avenue where there are no skyscrapers and there is comparatively little traffic congestion in the Wall Street section which has many of them.

Everything that could be done, apparently, in the way of police regulation has been done to handle this curious problem which has suddenly been developed by modern progress. It is not too much to say that the New York police has shown

inventiveness in mitigating the evils but the main body of citizenry has devoted itself to trying to escape the problem by restricting buildings rather than facing the real task boldly. For years now we have all realized that the street car lines should give way to the more modern means of transportation—the bus. And we still have the street car with us and little of anything is being done to get the car lines off the streets.

I remember having a talk in 1910 with Mayor Gaynor about elevated streets at Fifth Avenue and Forty-Second and at several other points in the city where the congestion is impossible, and today the fact remains that there are only two places in the city where the elevated streets have been erected—one at Grand Central and one at Fordham Rd. in the Bronx. The success of these two overhead streets in relieving traffic congestion is everywhere admitted and it would be hard to imagine what the situation would have been if this plan hadn't been put into operation. Both of these points represented unusually serious problems in traffic congestion. Yet no one has claimed that traffic congestion either at Grand Central or Fordham Road had anything to do with tall buildings.

When we know that London has today a more serious traffic problem than New York and when we realize that London has no high buildings whatsoever, we must realize how far wrong some of our estimable citizens have gone in tying the tall building up with the problem of congestion. And in addition to this we should remember that London has a topographical advantage, over Manhattan inasmuch as in New York the main arteries of traffic are confined to a few running North and South whereas in London there are many as the spokes of a wheel.

Even with this great advantage there is a serious movement in London for not only elevated streets and subways for vehicular traffic but underground parking space for automobiles. This traffic problem in London is not a matter of the city government alone but a matter that Parliament itself is endeavoring to solve through a Royal Commission on which are the ablest traffic experts of Great Britain. One of the ablest of these experts, Lord Montagu of Beaulieu, declared only a few months ago that drastic remedies must be adopted immediately. He proposed, "overhead viaducts, underground tubes, a minimum speed of 10 miles an hour for all vehicles using streets during rush hours, barring of horses from such streets, escalators for pedestrians, underground parking places for motor cars and buses of a new type with six wheels and a bigger carrying capacity than any now used in London." He declared, also, that "no more tramway lines

must be built, but motor buses gradually must supersede tramways."

The American public should be grateful to the American architect and the American engineer for what they have done in the evolution of the skyscraper. Surely there is injustice in seeing any notable body of citizens turn sour over what is after all a notable contribution to our civilization.

GIVE SUN AND AIR A CHANCE IN YOUR PLANT

BY MORITZ KAHN

Of Albert Kahn, Incorporated, Detroit
Reprinted by special permission from
Factory, the Magazine of Management

It is only of recent years that there has been anything like a general recognition of the value of good lighting and ventilating as factors in economical production. Many manufacturers (and far too frequently, the designers of their buildings), who should be concerned in securing the best and most productive working conditions, have been quite indifferent to these important matters.

A poorly lighted and ventilated building has a depressing effect on workmen and reduces their physical efficiency, resulting in lessened output and loss to both the man and his employer. Furthermore, there is nothing more certain than that dark shops are sure to be carelessly kept, which in turn leads to careless workmanship and wastage of materials. Even the most modern mechanical equipment loses much of its effectiveness if the operators work under improper conditions.

In general, industrial buildings are divided into two distinct types—the multistory and the single story. The former must derive all of its natural light and ventilation from the sidewalls, although the top floor can, of course, receive additional light and ventilation from the roof. In a multistory building the floor height should be great enough to allow daylight to permeate the entire floor area. Conditions will vary in different localities, but generally it will be found that a floor-to-floor story height of 12 to 14 feet will allow proper lighting of buildings from 60 to 90 feet in width, providing the buildings are lighted on both sides. In any event, the area of the glass in the sidewalls should not be less than 22¼% of the floor area to be lighted.

Not less than 35% of the area of the windows should consist of openings with ventilator sash, and for the best results the ventilators should be in two lines—the lower for the admission of cold, fresh air, the upper for the expulsion of the warm, foul air.

Multistory buildings of large size will often have wings or units projecting

from the main building. The width of the courts between these units should be such as will make it possible to obtain good lighting and ventilating conditions. This width will vary from 40 feet for two-story buildings to 72 feet for six-story buildings.

Proper lighting and ventilating conditions can easily be obtained in single-story buildings. These structures, covering large areas, will obviously be lighted from the roof, because the wall area will be but a small percentage of the floor area. The north-light or saw-tooth type of roof held sway for a long period, but experienced factory designers have, for the past 8 or 10 years, abandoned this form of construction in favor of forms which permit the utilization of more efficient and more economical roof trusses.

The north-light roof does not rate high in lighting properties because it produces a glaring effect when looking towards the light, whilst there is a gloomy effect when looking away from the light. Contrasts of glare and gloom are detrimental because they produce eye-strain. Furthermore, effective ventilation of buildings having north-light windows can only occur when the wind blows in a certain direction, whereas the ventilation of the building should be entirely independent of this condition. Another objection to the northlight roof lies in the difficulty and cost encountered in constructing water-tight gulleys at the lower ends of the trusses.

As an alternative to the saw-tooth type of roof, the Aiken roof proves cheaper and offers better lighting facilities. The Aiken roof consists of a series of rectangular-shaped monitors with vertical standard sidewall sash. The light comes from both sides of the monitors and thus eliminates the objectionable glare of the north-light truss. From the ventilation point of view the Aiken roof is but little, if any, better than the north-light roof. But for ordinary manufacturing buildings, where there are no gases or fumes resulting from the manufacture, the Aiken roof will prove serviceable.

Probably the greatest single advance in roof construction lies in the development of that type known as the "butterfly" or double saw-tooth roof. This form of truss is like a wide letter M with sloping or vertical sides, or a combination of both. Such a roof construction admits the light on two sides of the monitor, thus eliminating the objectionable glare previously referred to and, at the same time, it proves very efficient from the ventilation point of view, because proper ventilation always takes place, irrespective of the direction of the wind.

The monitors in the "butterfly" type of roof are high in relation to the flat portions of the roof and the wind passing over them creates a draft similar to

that of a chimney, thus causing a vacuum which draws out smoke, gases, fumes, excessive heat, and foul air. Furthermore, the difference in height and weight of the air column under the "butterfly" truss and the column under the flat portion of the roof causes a natural circulation of the air within the building. The fresh air enters at the lower portion of the monitor and the foul air is expelled, or drawn out, in the upper rows of ventilators.

The cost of the "butterfly" roof construction is slightly greater than that of the Aiken roof, but in buildings like foundries, steel mills, glass-manufacturing plants, forge shops, heat-treat buildings and similar structures, the extra cost is well warranted. In many buildings of this class the equipment will consist of high machine-tools which can advantageously be placed under the high monitors. In such cases the monitors can be constructed so as actually to increase the useful cubic capacity of the building and there will be additional justification for the slight extra cost which must be incurred.

Continuous top-hung sash is the type used in the "butterfly" truss instead of sidewall sash, and the lower end of the sash swings out to form an umbrella, so to say, over the opening below. Because of this protection it is possible to leave top-hung sash of this type open continuously except in the most severe weather.

While on the subject of monitor sash, it is well to mention that in any large plant the sash should be mechanically or electrically operated so that the mere pressure of a button will automatically open or close large sections of the sash at one time. Unless such facility is given for the operation of the sash, the workmen will fail to open the sash when it should be opened, or, on the other hand, they will fail to close it when it should be closed. And proper conditions of ventilation will only result from the opening and closing of the sash at the proper times.

The whole subject of lighting and ventilation is of course tied up intimately with the decision as to whether the plant shall be a single or a multi-storied building. The manufacturer himself is best qualified to decide whether the single or the multistory type of building lends itself best to his particular process of manufacture and is most efficient from the standpoint of local economic considerations. His decision will be based upon:

- (1) The process of manufacture;
- (2) Cost of land;
- (3) Sufficiency of ground area;
- (4) Possibilities of future expansion of the business;
- (5) Comparative costs of building;
- (6) Relative importance of lighting and ventilation advantages.

Whether the manufacturer adopts the single or the multistory building, he should always bear in mind that daylight and fresh air cost nothing and should both be used to the greatest advantage.

WASHINGTON, Oct. 25.—The cost of construction rose during September, returning to the level it held last April, according to statistics compiled by the Associated General Contractors of America. The rise off-set two slight declines that occurred during the four preceding months. It was the first increase noted since March.

Higher prices commanded by concrete materials and common brick in several sections of the country were responsible for the increased cost, it is stated.

The average of wages entering into the cost of construction remained unchanged. September was the eighth successive month to pass without witnessing a variation of the wage average.

The average level of costs, embracing expenditures for both materials and wages, for the first nine months of this year is slightly above the average registered during the corresponding period of 1926. The average for the elapsed portion of the current year is exactly twice as great as the average registered for 1913.

By rising during September, the cost of construction strayed from the trends established in 1925 and 1926. Two years ago, the month of September saw a slight decline, while no change occurred between August and October last year.

A scale which places the 1913 average at 100 as its basis shows the September cost index number to be 201. September of last year registered 196.

Index numbers covering the cost average for other months of this year are: January, 197; February, 199; March, 201; April, 201; May, 200; June, 200; July, 199; August, 199.

Similar figures covering the prices paid for basic construction materials follow: January, 179; February, 181; March, 183; April, 183; May, 182; June, 182; July, 181; August, 181; September, 184.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Many a man would do a better job if he didn't know about putty.—Ex.

write practically every form of Insurance, except life*

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear.

"ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement, increases its strength and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 23 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

Manufacturing Building, 407-409 Division street, Camden, N. J., \$3,800. Architect, private plans. Owner, John Marani, care of builder. Brick, 3 stories, 18x50 feet, slag roof. Contract awarded Guiseppi De Media, 1405 S. 4th street, Camden, N. J.

Miscellaneous Construction News

Sunday School, Salisbury, Md., \$75,000. Architect, Norman Hulme, 1524 Chestnut street, Philadelphia. Owners, Asbury Methodist

Episcopal Church, W. P. Jackson, Salisbury, Md. Stone, brick, 3 stories, 45x100 feet, slate roof, maple floors, vapor heat, electric light. Plans in progress. Ready for bids in two weeks.

Church, Kenmore, Ohio. Architects, C. W. Bolton & Son, Schaff Building, Philadelphia. Owners, Goss Memorial Reformed Church, Rev. Rollin Goodfellow, Kenmore, Ohio. Stone, brick, 1 story, slate roof. Plans in progress. Ready for bids in 6 weeks.

Press Building, Orange and Girard avenue, Wilmington, Del. Engineers, DuPont Engr. Co., Wilmington, Del. Owners, Every Evening Publishing Co., Wilmington, Del. Reinforced concrete, 3 stories, 60x110 feet, concrete roof, electric light. Owners sub-letting.

Public School, Gumboro, Sussex County, Del. Owners, Gumboro School District, State School Building Commission, George S. Williams, Chairman, Dover, Del. General construction (plumbing, heating and ventilating separate). Certified check, 5 per cent. Deposit, \$25, refunded. Copies of plans, specifications and proposal forms will be on file in office of Delaware School Foundation, 4116 DuPont Building, Wilmington, Del. Owners taking bids due November 18th at noon.

Public School, Millsboro, Sussex County, Del. Owners, Millsboro School District, State School Building Commission, George S. Williams, Chairman, H. V. Holloway, State Superintendent of Public Instruction, Dover, Del. General construction (plumbing, electric, heating and ventilating separate). Certified check, 5 per cent. Deposit, \$25, refunded. Copies of plans, specifications and proposal forms on file in office of Delaware School Foundation, 4116 DuPont Building, Wilmington, Del. Owners taking bids due November 18th, at 11 A. M.

Administration Building, State College for Colored Students, Cheswold, near Dover, Del. Architects, Guilbert & Betelle, Newark, N. J. Owners, Delaware School Auxiliary Association, A. J. Taylor, Dover, Del. Brick, steel, 3 stories and basement. Low bidders: R. R. Gove Co., 1712 Ludlow street, Philadelphia, \$81,253; Northeastern Const. Co., Baltimore, Md., \$84,780; electric, Electric Const. Co., Wilmington, Del., \$3,149.

School, Delmar, Del. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, Delaware School Foundation, A. J. Taylor, vice-president, 4116 DuPont Building, Wilmington, Del. Brick, steel, 2 stories and basement, 181x81 feet, slag roof, pine and cement floors, ornamental iron, bond, metal lath. Low bidders: Hastings & Parsons, Salisbury, Md., \$113,780; Northeastern Const. Co., Lexington Building, Baltimore, Md., \$117,840. Plumbing, Lewis

Morgan & Sons, Salisbury, Md., \$7,813. Heating and ventilating, Morgan & Sons, Salisbury, Md., \$16,000. Electric, E. F. Higgins & Co., 843 Tatnall street, Wilmington, Del., \$4,685.

Miscellaneous Contracts Awarded

Barracks (3), Camp Meade, Md., \$375,000. Architect, United States Quartermaster, Washington, D. C. Owners, United States Government, United States Army, Washington, D. C. Brick, reinforced concrete, steel, 3 stories and basement, 324x47 feet, 160x47 feet, 144x47 feet, monolithic roof, metal lath, rolled steel sash, bond, ornamental iron work. Contract awarded Palmer-Spivey Const. Co., Charlotte, N. C.

Convent and Academy Building, Syossett, Long Island, N. Y. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Sisters of Mercy, Syossett, Long Island, N. Y. Contract awarded G. F. Driscoll Co., 548 Union street, Brooklyn. Heating to E. Rutzler Co., 404 East Forty-ninth street, New York City.

BUILD THE ROOF TO SUIT THE PLANT

1. *A Water-tight Roof; the Roof and Lighting*

BY WENDELL S. BROWN

F. P. Sheldon and Son, Engineers and Architects, Providence, R. I.

Reprinted by special permission from *Factory, the Magazine of Management*

Thatch roofs, adobe roofs, caves with stone roofs. From time immemorial the roof problem has been with us and the counterpart of almost every primitive type of roof material—refined and improved to be sure—can be found, sometimes alone, but more usually combined with other materials, as either insulation or structural portion in the work of our present-day master builders.

PHILADELPHIA *Yesterday and Today*

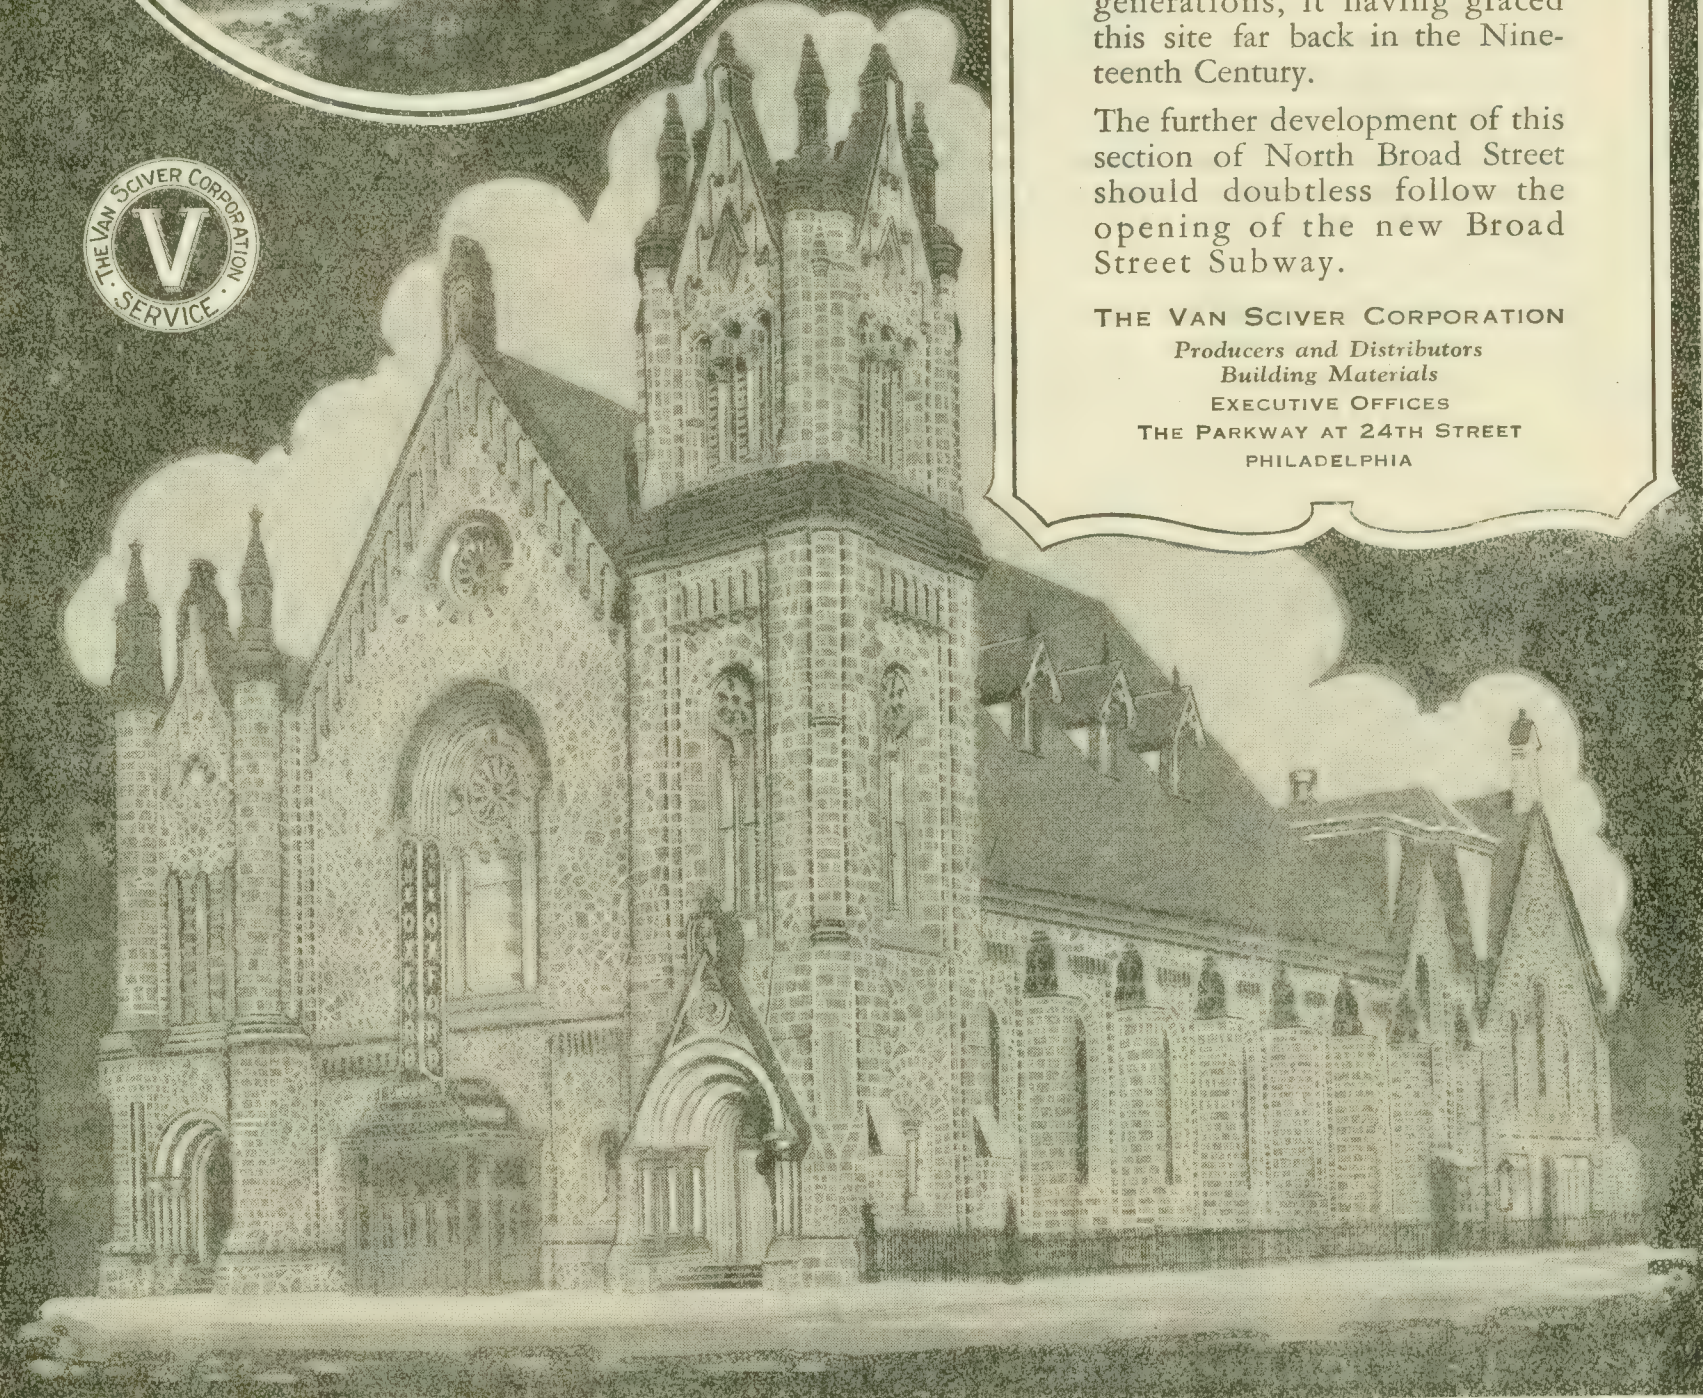

Broad and Oxford Sts.

TO MOST OF US, this intersection has looked the same for many years—yet the farm house depicted above precedes the present improvement by several generations, it having graced this site far back in the Nineteenth Century.

The further development of this section of North Broad Street should doubtless follow the opening of the new Broad Street Subway.

THE VAN SCIVER CORPORATION
Producers and Distributors
Building Materials
EXECUTIVE OFFICES
THE PARKWAY AT 24TH STREET
PHILADELPHIA

The roofing question for many industrial plants, especially those comprised largely of expansive one-story buildings in which the sidewalls may count for comparatively little as aids to natural lighting or ventilation, is a serious and relatively expensive one.

In smaller or multistory buildings the upper floor can often be advantageously designed as to natural lighting and ventilation to meet the requirements of some particular service or manufacturing process.

Among the first requisites of a good roof is water-tightness. This needs no elaboration. Regardless of first cost, interference with production and consequential damages from leaks due to inferior workmanship, materials or design, cannot ordinarily be tolerated. The choice of weather-proofing materials themselves depends mainly upon the slope of the roof, the underlying roof construction, color of surface for reflection of light, effect of local atmospheric conditions upon metal flashing, and so forth. Ultimate cost must be considered—that is, not only first cost in place, but also maintenance expense and capitalized fixed charges including depreciation.

Types of Roof Covering

Shingles of wood, of metal, of stone-coated impregnated felts, of asbestos, slate or tile; interlocking shapes of corrugated metal, of tile or of wire glass; continuous membranes of waterproof felts or metal—these are some of the possibilities which research, applied science, and industry offer us to draw upon and to combine at will in securing desired results.

Continuous roof coverings of the saturated or impregnated felt type may be obtained in the prepared or "ready roofing" form, or may be applied on the job as a "built-up roof," in which latter case the impregnated felts are usually rolled or mopped separately for their full width into hot pitch or compound. The entire surface as built up then receives a heavy pouring of hot pitch or asphalt, into which a course of slag or gravel is spread.

"Ready roofings"—their brands and respective qualities are legion—are usually cheaper in first cost than "built-up roofs." They fulfil some needs well, and may be used to advantage on isolated buildings, or small structures where skilled labor is not available, or for temporary service.

"Ready roofings," either ply or single, are made to be rolled and are therefore necessarily deficient in felts and saturant, as compared with built-up roofs." There is also the difficulty of laying them without wrinkles, and the fault of narrow laps.

"Built-up roofs" are suitable for flat horizontal surfaces or for sawtooth roofs, but not for slopes much in excess of 6 inches per foot. And for such slopes they must be well nailed and surfaced with asphalt compound to prevent sliding.

Exactly What Is a "Bonded Roof?"

To the owner who wishes to obtain inspection service in the case of a "built-up roof," security against leaks, and also free repair service for the subsequent estimated life of the roof, there is offered by competitive companies the advantage of a "bonded roof."

The service of one of these companies embraces, besides inspection at the time of application, also the furnishing of roofing materials and a list of local roofing contractors approved by them.

One weakness of this plan is that the bond does not extend to the metal work, such as gravel strips and flashings, skylights, ventilators and the like.

The bond does cover leakages elsewhere, however, and is furnished by a reputable national bonding company for a period of 10 or 20 years, depending upon the construction of both deck and roofing.

The initial cost of the contract for a bonded roof of this type might run 10% more than that for a "built-up roof" equally meritorious as to materials and workmanship.

The Four Problems of Design

The preceding paragraphs about roof covering have concerned the question of keeping out the weather. Correct design is necessary for the economic manufacture and control of artificial weather within the building, including daylight itself. This is accomplished through insulation, ventilation, and fenestration.

Here also the question of cost may be paramount. For certain occupancies anything more elaborate than an ordinary flat unventilated roof would be an unwarranted extravagance.

Utility in one form or another is the essence of superior planning. A dollar buried in the ground may still be worth one hundred cents, but a dollar wasted in building construction, besides earning no dividends, is lost forever.

Ultimate cost, as comprised of first cost plus properly capitalized fixed charges and maintenance (the latter being adjusted for resultant savings), is a vital factor.

The Lighting Question

First with regard to that element of design known as roof contour or configuration. This is largely a question of daylighting and natural ventilation requirements. Ordinary daylight often

needs tempering and modifying, especially direct sunlight, and reasonable thought and money put into each consideration of light and ventilation pays worth-while dividends in increased quantity and quality of production and improved health and morale of the workers.

The question of direct sunlight is frequently a controlling factor. That is, its admission may entail serious disadvantages from such considerations as heating effect, actinic effect, color value, and eyestrain due to contrasts and excessive intensity, the latter resulting often in such tremendous differences in illumination as 5,000 to 1 upon adjacent surfaces, to say nothing of reflection of sunlight from bright machine parts.

Then too, the question of direction, diffusion, and uniformity of natural illumination is of importance as affecting visual acuity upon either horizontal or vertical planes.

And it is likewise true in this connection that the daylighting of a wide building through the roof offers infinitely more possibilities than does daylighting by means of windows located in the walls. The tremendous variation from sidewall lighting is clearly due to the fact that, in the case of direct light, only the increasingly horizontal rays really penetrate as the interior of the room is approached.

Unfortunately only one story of a building can ordinarily be lighted through the roof.

(Continued next week.)

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Ideals are like stars; you will not succeed in touching them with your hands. but like the seafaring man on the desert of waters, you choose them as your guides. and, following them, you reach your destiny.—Carl Schurz.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

"ANTI-HYDRO" Keeps a River Out of This Power House

The concrete foundations of this building are below the water level of the river that flows beside it. Nevertheless, the basement and boiler room are always dry, because the concrete is *permanently* water-proofed with "ANTI-HYDRO."

"ANTI-HYDRO" is an easy-to-use liquid integral compound that both hardens and waterproofs *in one operation*. It mixes with the gauging water without the aid of skilled labor. It is very economical to use and results are guaranteed permanent.

For 23 years "ANTI-HYDRO" has been repeatedly specified and used by leading architects, engineers and contractors the country over. Use it on *your next job*.

"WHY BUILD TO BURN?"

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

Compo-Board

REG. TRADE MARK

Successfully used for walls and ceilings for over thirty years.
Insulates. Takes any decoration. Will not warp.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Sewer Parkeview avenue, Upper Darby, Pa., \$6,800. Owners, Commissioners of Upper Darby Township, Darby, Pa. Contract awarded to Carson & Carson, 22 S. 15th street, Phila.

Bank Building, Bryn Mawr, Pa. Architects, Thomas M. James Co., 342 Madison avenue, New York. Owners, Bryn Mawr Trust Co., Phillip A. Hart, Bryn Mawr, Pa. Reinforced concrete, brick, steel, granite, cut stone, 3 stories and basement, 105x84 feet, wing 28x64 feet, Barrett specification roof, cement floors, elevators, plumbing, waterproofing and dampproofing, area gratings, bronze work, ornamental iron work, casement windows, iron stairs, bond, tin-clad and kalamain doors, rolled steel skylights, hollow metal sash, tile and marble work, vacuum heat, electric light, oil burner, vitrolite, acoustical treatment, celotex, metal furniture, limestone, rubber mats, linoleum floors, cork tile floors. Contract awarded F. L. Hoover & Son, 1023 Cherry street, Philadelphia.

East End Junior High School (add.), Lancaster, Pa. Architect, M. R. Evans, 10 East Orange street, Lancaster, Pa. Owners, School District of Lancaster, Prince and Chestnut streets, Lancaster, Pa. Fireproof, 3 stories and basement, 280x125 feet, Barrett roof, linoleum floors, hollow tile, safety treads, roof ventilators, metal weather strip, waterproofing and dampproofing, Indiana limestone, cut stone, wrought iron pipe, iron stairs, bond, fire doors, tile, marble and terrazzo, metal lath. Contract awarded D. S. Warfel, 452 North Prince street, Lancaster, Pa., \$310,637. Plumbing, Paul E. Goodfisch, Lancaster, Pa., \$27,660. Heating, Musselman & Schwartz, 130 North Christian street, Lancaster, Pa., \$94,500. Electric, Mitchell & Co., 1337 North McFerren street, Philadelphia, \$19,990.

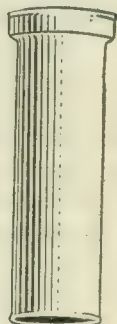

Office Building, Wyncote, Pa. Architects, Heacock & Hokanson, 1211 Chestnut street, Philadelphia. Owners, Nicholson Brothers, Wyncote, Pa. Brick, steel, 1 story and basement, 20x33 feet, slate roof, pine floors, plumbing, hot water heat, electric light. Contract awarded Stahl & Walton, Willow Grove, Pa.

Store and Apartments (2), Meadow lane, Chester, Pa. Architect, A. Coshland, Chester, Pa. Owner, Oscar Baylin, care of architect. Brick, 2 stories, hot water heat, slag roof, hardwood floors, electric light. Contract awarded Jacob Goldberg, Chester, Pa.

Parsonage, Bethlehem pike, above Tennessee avenue, Bosler, Pa. Architect, William F. B. Koelle, Otis Building, Philadelphia. Owners, The Artman Home for Lutherans, on premises. Stone, brick, steel, 2 stories and basement, 27x27 feet, shingle roof, oak and pine floors, plumbing, hot water heat, electric light, tile work, hollow metal sash, iron pipe. Contract awarded Angelo DeRenzo, Bristol, Pa.

Church, State College, Pa. Architects, Bailey & Bassett, 421 Chestnut street, Philadelphia. Owners, St. Andrew's Protestant Episcopal Church, State College, Pa. Stone, brick, cut stone, 1 story and basement, 63x35 feet, wing 23x54 feet, wing 29x20 feet, green slate roof, cement and pine floors, hollow tile, plumbing, wrought iron pipe, ornamental iron work, vapor heat, electric light, metal lath, tile and terrazzo work, bluestone. Contract awarded Berkebile Brothers, Johnstown, Pa.

Theatre, Stores and Apartments, Allentown, Pa. Architects, Thalheimer & Weitz, 10 South Eighteenth street, Philadelphia. Owner, name withheld. Brick, steel, 2 stories and basement, 94x120 feet, slag roof, oak, pine and cement floors, plumbing, steam heat, electric light, metal lath, bond, ornamental iron work. Contract awarded William Linker Co., 735 Cherry street, Philadelphia.

Residences (8), Wilmington, Del., \$6,400 each. Owners, Brenwood Co., Ninth and Orange streets, Wilmington, Del. Brick, 2 stories, 18x33 feet, slate and slag roof, hot water heat, electric light. Contract awarded Stephen Jackson, 823 Orange street, Wilmington, Del.

AMERICAN CONSTRUCTION COUNCIL

The deliberations of the Sixth Annual Convention of the American Construction Council, Franklin D. Roosevelt, President, to be held at the Hotel Statler, St. Louis, Mo., December 1st to 3rd, will center along the general theme of "Assaying the Construction Industry—Its Needs and What Should Be Done About Them," according to announcement made by Dwight L. Hoopingarner, the Council's Executive.

With the transition from the hectic building conditions of the past few years into the coming period of more modulated construction, it is felt that the most important service the Council can render the construction industry and the public at this time is to make a searching assay of trends and tendencies and underlying relations throughout the entire construction industry and give careful consideration to what these may augur for the future.

Emphasis throughout the convention's deliberations will be directed toward a two-fold purpose—building better business for the building industry and at the same time putting the public interest paramount, which as the Council has continuously brought to the attention of all concerned for the past five years must go hand in hand for healthy business not only in construction, but for the country at large.

The convention will, therefore, take on the atmosphere of round-table discussions with speakers of national prominence addressing the gatherings to focus attention along these lines.

S. Libman, formerly with the Sterling Products Company, which was absorbed by the Arco Company, has now started in the manufacture of caulking and roofing compounds and kindred products. His Philadelphia address is P. O. Box 33.

BUILD THE ROOF TO SUIT THE PLANT

1. *A Water-tight Roof; the Roof and Lighting*

BY WENDELL S. BROWN

*F. P. Sheldon and Son, Engineers and Architects, Providence, R. I.*Reprinted by special permission from *Factory, the Magazine of Management*

(Continued from last week)

Two Plans of Lighting

Roof design seems to divide itself into two major types as to fenestration or window arrangement. First is the one-way type, in which the directly entering light comes from the same portion or half of the sky. The ordinary saw-tooth belongs to this type.

Second is the two-way or opposed type, in which the entering daylight is derived from opposite portions of the sky.

The monitor roof and the opposed saw-tooth exemplify this type. Horizontal roof openings covered with a flat or hipped skylight may be considered as an extreme case coming under this classification.

It should not be inferred from the above classification that the one-way arrangement produces unidirectional lighting as against lighting from two directions with the other type. A properly designed saw-tooth roof produces excellently diffused light on account of the enormous angular size of the light source, and on account of reflection from the ceiling, while the two-way type, which admits considerably greater amounts of direct sunlight, may result in what is, by contrast, intensely unidirectional light.

It is perfectly practical with any given design to calculate definitely the time of admission of direct sunlight, its duration and varying location, and the form of sun streaks upon the working plane for any day in the year, provided the latitude of the place and the orientation of the building is known.

Such computations involve simple trigonometry and descriptive geometry and for many occupancies offer plainly profitable possibilities.

By facing the glass of a one-way saw-tooth roof away from the sun (that is, north, in the northern hemisphere) and fixing the slope of the glass in accordance with the latitude of the place, the roof can be designed to prevent all direct sunlight whatever from entering the building throughout the average day of the year and also during most of the working-hours of the longest day of the year. The important point is to do so without undue sacrifice of diffused daylight. It is also a relatively simple matter to compute accurately the comparative illumination for different designs.

Tempering Direct Light to the Work

Often direct light from the sun and sky falling upon the adjacent saw-tooth roof may be used, being tempered by double reflection, first from the back of this roof, thence through the glass to the adjacent saw-tooth ceiling, and thence to the work.

The curbs under the glass of saw-tooth roofs should be made as low as is consistent with protection against the elements—this not only from the standpoint of first cost but also of good lighting.

And it seems to be a happy coincidence that in the South, where a very appreciable decrease in daylighting would otherwise occur, due to the increased slope of glass required for shutting out the sun at these latitudes, this loss is largely compensated for by using a shallower valley than would be advisable in northern climates where accumulations of snow and ice are to be reckoned with in cold weather.

Opposed saw-tooth and monitor types of roofs, however, cannot be designed to eliminate direct incidence of sunlight upon the lighting areas. Reliance must be placed upon certain more or less unsatisfactory expedients for reducing its effect. For instance, whitewashing the glass offers some protection but produces glare, and, on cloudy days, a serious loss of illumination.

Curtains or venetian blinds are impracticable in a large proportion of industrial buildings, and ribbed glass collects dirt and may produce, in addition, objectionable glare.

In the case of one-way saw-tooth roofs, if the locality and service permit of maintaining white or light-colored roof and ceiling surfaces, increased light resulting therefrom may amount to as much as 30% or 40%. This requires the use of white slag or gravel on the back of the saw-tooth and of white paint on the ceiling.

It is not necessary to emphasize the fact that dirt is an important factor in the reduction of light transmission through glass. However, light transmission is often reduced, from this cause, as much as 50%, 75%, or even 90%. Dirt is especially apt to collect on non-vertical surfaces. It is becoming quite customary to furnish buildings with equipment to facilitate the maintenance of clean windows.

Much of the effectiveness of any arrangement of windows will be lost if they are not periodically taken care of and ease of cleaning and access should be one factor taken into account in planning on the type of fenestration to be used.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

THE "USED" HOME AND THE NATIONAL PROSPERITY

BY GEORGE E. PIPER

*The Household Magazine**An address made to the Southern Builders' Supply Association at Biloxi, Mississippi.*

Mr. President and Gentlemen:

I believe it is safe to assume from the fact that you have invited me to discuss this subject that many of you are somewhat anxious about the future volume of building material business and profits. In some of your towns and cities building is still proceeding without any letup but in others it is declining slowly,—while in some it is already very quiet and in many others in a state of serious stagnation.

Since I am appearing before you as sponsor for a new thought or idea in the building situation, it might be well for me at this time to explain that this is due to the sheerest accident. Nearly a year ago I was asked to assume some of the responsibility in determining just what type of editorial department would best serve the large list of *Household Magazine* subscribers in the most helpful, interesting and timely manner. Nearly all magazines and newspapers devote a great deal of attention to housing, and have been very helpful in promoting and inspiring higher standards of living. Usually almost exclusive attention has been given to New Homes; plan services have been offered and in various other ways these publications have contributed substantially toward a higher standard of living and a greater prosperity in the building and construction field.

In discussing our problem with many retailers, manufacturers, trade publications, trade associations and others who were in a position to be well informed in the building field, and after surveying the building situation and its future prospects as completely as possible, it was impressed upon me that the most constructive work we could do, editorially, would be not only to discuss the new home but also to inform and enthuse our subscribers regarding the possibilities that lay before them in the Remodeling and Rehabilitation of existing but not quite modern homes.

It was pointed out that residential construction is on the decline and that it was questionable if all types would hold their large present volume, that the large surplus manufacturing facilities, and with the distributing and surveying divisions of the industry expanded to meet the pressing demands of the recent building boom, there was a serious question regarding the future prosperity of the entire building industry.

The actual volume of business going through dealers' hands is decidedly off,—profit margins are narrowing in many lines, speculative building is receding, in

many communities it is overdone and structures are reverting to the financial interests. Many building and loan associations are loath to finance construction except in the hands of permanent resident owners.

Since a substantial proportion of new houses are acquired by previous home owners, this type of construction is also slowing down because of the "trade-in" problems involved by the old home.

The old home must be liquidated before the new home can be financed. This unthought of factor,—the "used" home, is becoming quite a problem which some responsible persons believe may, in the near future, become as much of a problem as the used automobile has been in the transportation field, assuming, of course, that the building industry would like to continue its present high status of activity. This is a new and perhaps extreme viewpoint which only recently has begun to appear in the building field.

It is surprising, even astounding, that such a situation is developing at a time when the country as a whole was never more prosperous. The number of motor cars purchased in 1926 was 12% greater than the purchases in 1925. The more expensive class of cars (other than Fords) increased 24.3%. In the Southern states there was a 24% increase in all car sales and a 57% increase in the sales of the better class of cars. The first five months of this year there has been a 30% increase in the sales of the better class of cars.

The cash income in the hands of consumers is much greater than we ever expected to enjoy. There has been an unbelievably large increase in the National income. There are sufficient funds available in the hands of the building and loan association banks and financing companies to finance a far greater building program than has ever been undertaken at any time.

There is no reason why building operations as a whole, and especially the detached dwelling field, should not be proceeding at a far greater pace than ever before.

Yet all of us know that there are many millions of families living in very undesirable, obsolete or inadequate, uncomfortable and even unhealthful or unsafe conditions.

The National Federation of Women's Clubs has recently concluded a survey covering all sizes of towns in all states. They have found that there are many millions of families who do not even have running water in the house and many more who do not have modern stationary bathtubs, indoor toilets, kitchen sinks and laundry equipment.

Millions of homes are also inadequate and unsatisfactory in many other ways, exterior appearance, interior comforts and attractiveness. The South has its

share of such homes. In fact, only a small part of the population is living under completely satisfactory housing conditions.

I do not wish to pose in any calamity role; I do not believe that the prosperity of the national community is going to decline seriously. I firmly believe that there will be a large volume of building activity regardless of what is done. I would simply like to point out that there is some evidence of slackening in building operations and you appreciate, of course, that this might be a matter of concern should any decline become too abrupt. It has embarrassing possibilities, not only to the manufacturers of building materials, supplies and equipment but also to the fifteen to seventeen million people dependent upon this industry. Should the profits and labor income of this large part of the population be seriously affected, it then becomes a serious matter to all business and to every person, since this industry is one of the most important props of the entire business structure.

Happily, and regardless of whether there is any decline, it would seem that a course of action is clearly indicated which not only offers immediate relief in any community where relief might be needed, but also a much greater volume of business and building activity and prosperity in all phases of the building and construction field and in every community.

This line of action, in the opinion of many, develops possibilities for nearly as large a volume of business as has ever been enjoyed under new construction.

It is also thought that such action, if successfully undertaken, might,—by virtue of developing a better organization of the business of this industry and its allies (the realtors, financing groups and others) open up undreamed-of opportunities in the advancement of building activity and housing standards.

I will not attempt a statistical analysis of the national housing situation. Were I to do so it would be necessary to admit that the sum total of information is meager; that very little is known regarding the housing conditions of our twenty-four millions of people nor of the economics of the housing situation. Much research and economic study is needed in this field and would be very valuable.

We do know that recent rapid advances in architectural styles, health, social and other standards have been so marked that homes built only a short time ago are now obsolete and not satisfactory to the average housewife.

We know that in almost every town and city there are a very large number of these houses so well located and well conditioned that they will be utilized for years. Their number is so large that their occupants constitute the backbone of the market for most of the more ex-

pensive commodities. Out of this group is recruited each year a very large proportion of the new home buyers.

Most of these homes could also represent a substantial advance in living and social standards for younger families, providing of course they were made acceptably modern.

Because of these many reasons we were impressed that an Editorial program stressing Home Rehabilitation would not only represent the most intelligent service that could possibly be rendered our subscribers, but might also represent a public economic service. Once launched upon this editorial program, we found it attracting a great deal of interest and attention.

In order to obtain first-hand, personal experience and to be able to discuss the subject intelligently with our readers, we went into a typical Illinois town of 8,000 people and completely remodeled an old home.

After the demonstration was well under way, we invited a group of building trade publication editors to visit it. These editors were much impressed and incidentally informed us that this was the first occasion so many diverse interests of the building industry press had ever been brought together.

Other trade publications were contacted, with the result that forty are cooperating in bringing about an organized public consciousness of the possibilities in this field of Home Rehabilitation; architects, municipal, electrical, paint and decorating, building material, plumbing and heating, financial, contractors and various other types of publications are carrying this story to their readers.

We now find that the entire program is meeting with such an enthusiastic response from all sections of the country that it is now being taken up by organized groups. The United States League of Building and Loan Associations Commission on Better Relations adopted the following report at its annual meeting at Asheville, North Carolina, in July. The report is long, so I will read only the most important excerpts:

"The National Home Rehabilitation Movement, which is sponsored by *The Household Magazine*, and which is being taken up with eagerness by the building interests, should include as an integral part of its program the popularizing of the idea that extensive remodeling can be financed easily through the Building and Loan Association.

"The Building and Loan Association must not wait to be approached, however, but must, on its own initiative, tie in its activities with this movement which promises to be almost as important as the construction of new homes.

(Continued next week.)

**"ANTI-HYDRO" Keeps a River Out
of This Power House**

The concrete foundations of this building are below the water level of the river that flows beside it. Nevertheless, the basement and boiler room are always dry, because the concrete is *permanently* water-proofed with "ANTI-HYDRO."

"ANTI-HYDRO" is an easy-to-use liquid integral compound that both hardens and waterproofs *in one operation*. It mixes with the gauging water without the aid of skilled labor. It is very economical to use and results are guaranteed permanent.

For 23 years "ANTI-HYDRO" has been repeatedly specified and used by leading architects, engineers and contractors the country over. Use it on *your next job*.

Power House, Kent Mfg. Co., Clinton Heights, Pa.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

THE "USED" HOME AND THE NATIONAL PROSPERITY

BY GEORGE E. PIPER

The Household Magazine

An address made to the Southern Builders' Supply Association at Biloxi, Mississippi.

(Continued from last week)

"As a financial institution, the Building and Loan Association must emphasize the economic aspects of home rehabilitation:

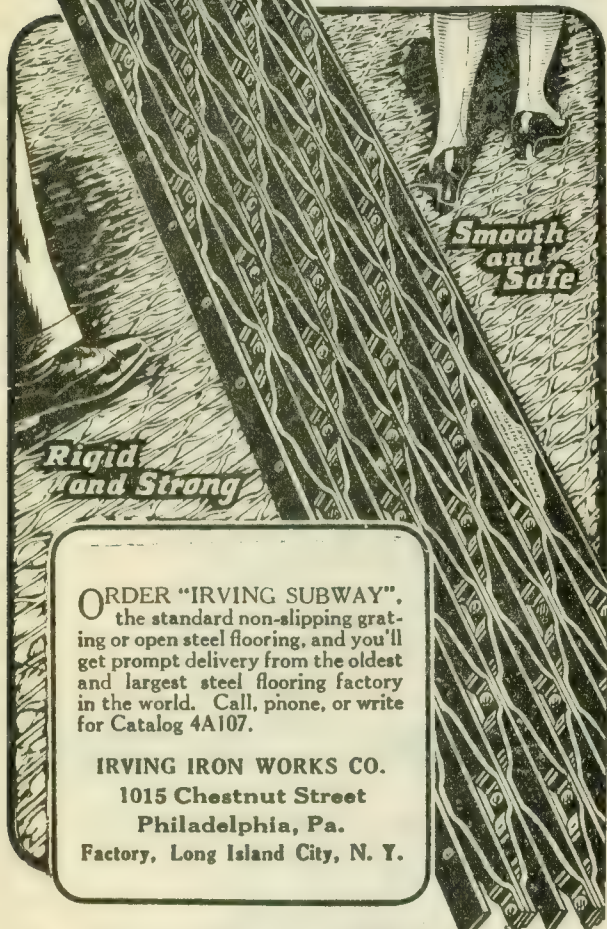

1. A home is an investment which must not be allowed to deteriorate.
2. Rehabilitation means greater resale value.
3. Rehabilitation is a form of insurance which the householder should carry to protect his family in the event of his death and a consequent forced sale of the property.

"Assured of building and loan associations financing for their customers, dealers in electrical fixtures, furnaces, instantaneous heaters, and the like, should make the Home Rehabilitation Movement a means of increasing greatly their business at little additional expense."

As illustrating the practical possibilities in this field, I would like to report the experience of Decatur, Illinois, a town of 40,000 population, which within the last few weeks has ventured a leadership in rehabilitation work.

Decatur has enjoyed a very active building program, including subdivision expansion. Its building activities were beginning to decline; some felt that there was possibility of approaching a status of overbuilding in some lines of new construction. A building and loan association president found himself facing three problems: First, he was alarmed by the decreasing equities in the older properties on which he had made loans. Secondly, he was slightly uneasy about the high loans necessary in order that new construction be undertaken. Thirdly, he was concerned about the large amount of

ENGINEERS AND CONTRACTORS**

3935 SANSOM STREET, PHILADELPHIA

capital which he had available for financing building properties but was unable to place.

He saw that large amounts of capital were disappearing or becoming frozen in the older properties,—that this was causing altogether too wide a differential between the sales value of the older property and the cost of new construction, with the result that many home owners who, because of growing families, social ambition, or increasing incomes, might wish to acquire a new, modern home, were finding it increasingly difficult to dispose of the old home without too great a sacrifice, a situation which unless remedied might eventually constitute a stiff hazard imperiling the values of new construction.

This building and loan president lumped all three problems into one. He went to the other building and loan presidents, to the banks, to the more progressive building material dealers and contractors, and took them out for a survey of the town. He pointed out how one house, fallen into bad repair, immediately depreciated in value, and also depreciated all the other houses on the street; how one section of one community if not properly maintained might affect the entire community.

The newspapers were called in and an informal Home Remodeling Co-operative Program was inaugurated. Everyone chipped in a small amount of money and instituted an advertising and general promotion campaign in the interests of Home Rehabilitation.

One or two of the building material dealers put on special plan men and instructed their salesmen to encourage this type of business.

While this movement has only been on a very short time in Decatur, one of the building material dealers reports a 156% increase in this type of business. The Building and Loan Associations report an increased volume of business, and although few of the business men concerned have kept separate records of this type

of business brought in through their co-operative effort, all report a nice volume and seem very well satisfied with progress made to date.

It is also interesting to know that a very fine volume of new construction is going on. Some of the local people believe that the Remodeling Program has actually stimulated new construction, since it has created a better morale and maintained a higher status of prosperity.

In Minneapolis the McDonald Lumber Company have stimulated this type of business through a small advertising campaign in one of the Minneapolis newspapers. The first ad, costing \$3.00, before 9.00 o'clock of the morning on which it appeared, sold over \$1100.00 worth of a variety of building material and also created work for carpenters, painters, electricians and others.

This company has working arrangements with a large list of carpenters, plumbers, painters, electricians and others and has organized its remodeling department quite efficiently and effectively. I cite this merely to indicate that one man or one company in a city of this size can lead and demonstrate the opportunity in this field very profitably.

In Kansas City the business men interested in the older downtown section have put on a rehabilitation program which involves changes in store fronts, additions, changing store interiors, lighting, etc., which will greatly improve the appearance of this old business section and will bring back trade.

Numerous small towns have completely rehabilitated their business sections, in many instances putting in new sidewalks, modern street lighting systems, paving streets, etc., in addition to remodeling the business buildings, with the result that they have greatly increased the volume of business coming to the town.

A school teacher co-operating with a contractor and starting on a "shoe string" in a small Illinois town has not only created a good income from remodeled properties which she now rents but has

also purchased old properties, rehabilitated them and sold them at a profit.

These demonstrations have greatly stimulated building activities in this town. The building material dealers report that this type of business now amounts to approximately one-half of their total sales.

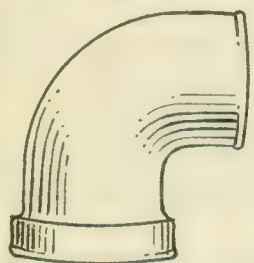

I can cite you other instances of contractor activities to tell how a plumber has engaged the services of a carpenter and developed a nice volume of business.

In another town a general contractor who was engaged in cheap new construction later changed to face-brick construction and is now operating a larger force of men entirely in remodeling work than he had at any previous time. The building material places in this town are prosperous.

In Chicago a new type of building construction has developed within recent months and report they will do over a million dollars worth of business in remodeling of older structures this year. They have a force of spotters out who locate properties that can be remodeled. The salesmen call and see these prospects. This construction company's own workmen do all the work; the company handles the paper necessary through a financing company.

You will remember back in the war period there was a shortage of both materials and labor available for housing. Later there was such a scarcity of housing and general types of construction that this labor and material was available generally only for new construction. Every jack-of-all-trades became a contractor or dealer of some type, with the result that during this period and also during the

war period many dealers, architects, contractors and others discouraged the remodeling and repairing of older properties. In many towns and cities this unfortunate attitude may still exist.

How big and how important is this field of Home Rehabilitation to the building material dealers of the country? I believe it is very great, and it offers in each of your towns and cities, as estimated by the Building and Loan Association, almost as large, or perhaps a larger volume of business than you have enjoyed from new homes.

Perhaps one-half to two-thirds of all the homes in the cities, including a large proportion of the apartment dwellings, the

well-conditioned, well located, but not quite modern homes have a market for your materials. The newest, most modern homes, and the poorest located, worst conditioned and most obsolete of the older properties are not included in this group.

The Building and Loan Associations are planning to push this type of building very aggressively. There are progressive building and loan associations in each of your towns. They will be glad to talk with you; so will others in your home town building circles.

The plumbing and heating industry knows that a large part of its future sales volume must be obtained from existing

homes. The paint industry is largely concerned with existing dwellings. The electrical industry knows that only a very small percentage of the homes have modern lighting fixtures and electrical outlets. The fire chiefs, fire insurance companies and underwriters know that the wiring is unsafe in a high percentage of the homes now having electrical facilities.

Nearly every group in the building field is hungry for business and you will find ready co-operators among all of them. Among those who will prove valuable are:

1. The Building Material Commodity groups, individual manufacturers, the trade organizations in the building field. In some instances this includes jobbers.

2. The Building and Loan Associations, Banks, Finance Corporations, Personal Loan Banks. Also, investment banks, specializing in mortgage securities.

3. The National Fire Insurance Companies, the local fire insurance agencies, and local underwriters.

4. Local chapters of architects.

5. Civic organizations, chambers of commerce, service organizations, such as rotary clubs, etc.

6. Local Federations of Women's Clubs, because of the interest taken by the National Federation in Home Improvement.

7. Most of the realtors, particularly those specializing in rented properties, or dealing in older properties. The realtor, as the agent of the property owner, is in an advantageous place to suggest remodeling or rehabilitation to stimulate sale or rental.

8. Local civic board governmental group, including fire chiefs, health officers, housing commissions, etc.

9. Local newspapers.

Various other groups will occur.

There are many salient selling points that can be used in selling both present and prospective home owners. A few of them are:

A more attractive exterior.

A modern and attractive interior arrangement.

Greater living comforts.

Easier heated in the winter, cooler in summer.

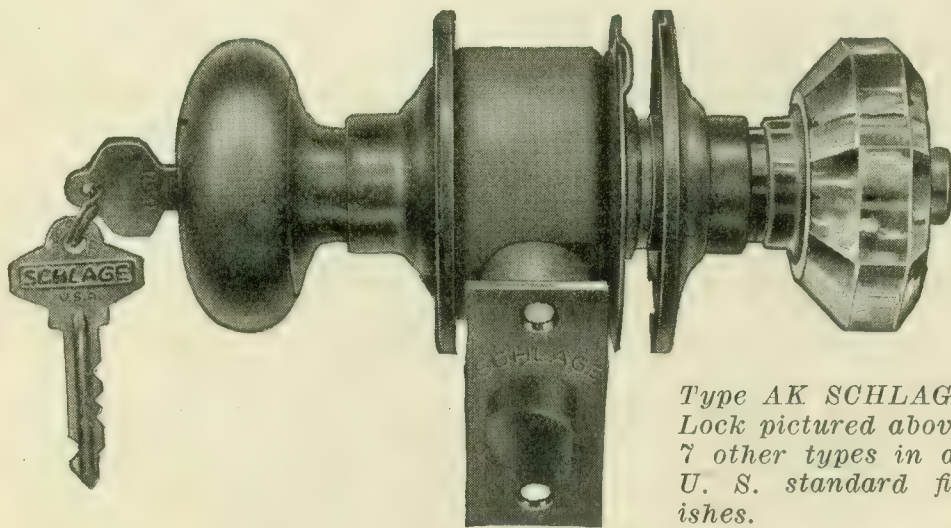

The acquirement of modern equipment (bathroom, laundry, kitchen.)

Greater resale value.

Insurance protecting the family in the event of death and consequent forced sale of the property.

To the renters you can propose that they can acquire a satisfactory modern home of ample size immediately, at a smaller cost.

To your local community as a whole you can suggest improved local prosperity, the release of unproductive capital, or the creation of new capital in the hands of the home owner.

It can be pointed out that values can be maintained more satisfactorily in each neighborhood,—that Home Rehabilitation is a necessary step in any civic improvement program,—that fire risks can be lessened.

The financial groups will be glad to conserve values and to find the outlets for their large accumulations of unproductive funds.

While it is probably unwise to make too close a comparison between the automobile industry and the building industry, it is nevertheless pertinent to point out that while the automobile industry has been improving and selling new cars with the greatest vigor, it also has given a large part of its time and effort in maintaining the capital investments in, and a liquid market for, cars in owner's hands at the highest point possible. If they had not made this second effort, I doubt very much if the automobile industry would be enjoying its present high status of prosperity.

In closing I would like to inquire if it might not be possible for the building industry, through co-operation with its allies (the realtors, financing organizations and others) to obtain a better organization of their mutual business with the expectation of immediately creating a higher status of building and general prosperity, and also, through the conservation of many millions of invested capital to so improve their mutual prospects that no one could predict the building operations or the housing standards of five, ten, fifteen or twenty years hence?

CONTRACTOR'S RIGHT TO PAY FOR EXTRAS

"There is to be no change in the work to be performed under this contract unless it is covered by written agreement, which must also say how much is to be added to or deducted from the original contract price on account of the change."

That, in substance although not in precise words, was that a California contract for remodeling a building provided. Because there was not strict compliance with the provision, litigation resulted. It was held by the California District Court of appeals (Bavin & Burch Company vs. Lard, 255 Pacific Reporter, 200) that a contractor was saved by a written order for changes after verbal orders had been acted upon. But the following language of the court's opinion will serve to emphasize the importance of close observance of the requirements of this very common clause:

"Courts generally have held this provision in a building contract as valid and binding, and have further held that without compliance therewith by the contractor the owner cannot be charged for extra work. . . . Indeed, in almost every juris-

diction the rule is accepted, though in some courts a tendency has developed to modify the strictness of the rule by declaring a waiver when benefits have been accepted and retained. The purpose of a provision of this sort in a contract is to protect the owner from unnecessary or unwarranted expense and to assure him that there will be some limit to his outlay. The average person desiring to construct a home or other building would be wholly at the mercy of his architect and contractor if the courts were to hold such a provision ineffectual for any purpose. No harm can come to the contractor, nor can any loss or damage ensue to him, by a strict enforcement of a provision of this character. He has his contract, and is bound only by the provisions thereof. He is not bound to do anything extra without written order, and knows that if he does he must speculate upon the owner's pleasure as far as payment is concerned."

But the same opinion shows that a clause of this kind is not so far sacred that it cannot be modified or rescinded by verbal agreement. It will not be enforced against a contractor who shows a distinct understanding with the owner for changes, although that understanding may have been oral. But the trouble about a reliance upon a verbal agreement modifying or superseding a written agreement is that the person asserting the verbal agreement has the burden of proving it, and if the owner denies having made that agreement the contractor may be "out on a limb," so to speak.—*Building Age*.

Construction operations, facing the advance of colder weather, decreased in volume during October, according to statistics compiled by the Associated General Contractors of America. The drop was not great enough, however, to deprive 1927 of its chance to set a new record for construction activities. The total volume for the first ten months of this year is five per cent. greater than the figure registered for the corresponding period of 1926.

The October volume was eleven per cent. smaller than the September mark. But the plane of activity two months ago was so high that, despite the perceptible drop last month, a total greater than ever before registered in the month of October was established.

In no year since 1921 has the month of October shown an increase in construction activities.

These figures, based upon shipments of construction materials, cover all types of construction. It is reported that residential building has shown a decline during recent months, but the volume of commercial and engineering construction has increased sufficiently to raise the total for all types to a new record.

An index which places the 1913 average at 100 as its basis, shows the index number for last month's volume to be 222. Corresponding figures for other months of this year are: January, 129; February, 121; March, 135; April, 166; May, 197; June, 212; July, 221; August, 238; September, 236.

The volume of contracts awarded during the first nine months of this year is appreciably greater than the figure registered in the corresponding period of 1926. This fact, coupled with the comparatively high degree of construction activity noted at the conclusion of October is taken as indicating that the opening of winter will find operations moving at a lively pace.

The cost of construction remained unchanged during October.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

"ANTI-HYDRO" Keeps this Huge Warehouse Dry

UNIT C, ARMY SUPPLY DEPOT, CHICAGO, ILL.
S. Scott Joy, Architect. E. W. Spraul Company, Contractors.

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent*. Twenty-three years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through*, instead of a thin surface coating. Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

THE BUILDING SITUATION

There has been a general decrease in building activity over the country during the present year. This is by no means an unhealthy sign, nor should it tend to pessimism as to the future outlook. The volume of new work is large enough to prevent any serious amount of unemployment; and there continues to be a great demand for better housing. Any idea of overbuilding may be discounted by a review of facts and figures; the normal growth of population and business requires not only more accommodation, but it requires it of higher quality. This involves a considerable amount of reconstruction, repairs, improvements.

A statement issued by a leading bond and mortgage company puts this in a convincing way:

"There is a great force at work today which has gained surprising velocity since the war. This is the force which makes us continually better our standards of liv-

ing. The greatest accelerator of this force is advertising. Advertising makes us want better bathrooms; better kitchens; better heating plants; better furniture;

better radios; pianos; foods, and so on, through the whole gamut of the luxuries and necessities which make up the framework of modern living. Advertising in turn keeps business active. It stabilizes demand and continually forces the producer of merchandise to keep alert to maintaining the standard of his product at the highest possible point.

Those who believe that we may by some black magic of the mysterious arts return to the lower standards of living of fifteen or twenty years ago do not take into account the changes which have come over business during the past decade—even some laws of economies have suffered change.

"The general prosperity which is now in full view must of necessity affect favorably the entire population. This condition of course makes an increasing demand for new housing, better working conditions, greater office space."—*Pacific Coast Architect*.

PLASTER TO BE MADE SOUND ABSORBENT

Work is under way at the Bureau of Standards, Washington, to develop a sound-absorbing plaster for use in auditoriums, to prevent the excessive reverberation often produced in such rooms by the high reflecting power of ordinary plasters. It is considered that for this purpose the surface should absorb 10 to 15 per cent. of the incident sound. Plasters made with porous aggregate, such as pumice, are already available, but they present mechanical difficulties in application and require very careful workmanship. It has been found, however, that by mixing small amounts of alum and a carbonate, such as lime carbonate, with the dry mixture of calcined gypsum and sand, an easy working plaster having the desired surface porosity is obtained. When the plaster is wet, the alum and carbonate form carbon dioxide, which produces many small bubbles of gas in the plaster. Various fine aggregates have been tried; up to the present pumice, calcined diatomaceous earth and tufa give the best results.

ROUGH FINISHES DOMINATE IN EXPOSED SURFACES

Architects are finding that the rough, common brick lends itself most satisfactorily to such effects in home construction

Rough finish is the dominant note today in nearly all architectural and interior finish treatments where the materials retain their natural surfaces in exposure. The plastered wall today looks as if the children had finished the job. The brick wall is more often than otherwise either

skintled or semi-skintled. The slate roof shows broken corners and uneven thicknesses of slate. The timbers in the brickwork and in the stucco show the marks of the adze instead of the smoothness of the plane, and the stucco itself might just have been thrown against the wall and stuck.

Mechanical exactness no longer appeals either in the materials or the workmanship. Bricklayers still use a line and a plumb bob, but the inside of the wall just as often as otherwise is the one to which they are applied. Skintled brickwork is responsible.

Common brick with all their unevenness frequently have to make way for their former castoff brothers, the clinker brick. Architects the country over are pleasing the most aesthetic home builder with common brick, combined with timbered effects in stucco and heavy hand hewn timbers, casement windows, occasional stone trimmings and heavy, irregular slates for the roofs. Such a combination is irresistible.

MERCHANTS INTRODUCE AUTOMARKET FOR WOMEN

Shoppers May Drive Through Stores and Buy—Control Air Conditions

Housewives in many cities may now shop for everything from dry goods to groceries and meats without leaving the steering wheel of the family car.

This has been made possible by recent advances in the science of made-to-order weather and the development of an ingenious new type of grocery and department store known as the "Automarket." There is no need to fear carbon monoxide or poor air conditions, as powerful ventilating fans, similar to those used in any efficiently managed public school or theatre, change the air every minute. Vitiating air is mechanically exhausted and a new supply brought in and washed or filtered before it is distributed to all parts of the building.

When the shopper reaches the Automarket, she drives through the right door of the store, circles around at her pleasure on special aisles lined on each side with counters of merchandise displayed on revolving shelves, buys what she wants and drives out through another door when she is through. Besides solving the parking problem in congested cities, the system has the further advantage of bringing producer and consumer directly together, its proponents assert. And cumbersome bundles thus may be tossed directly into the car and taken home.

Enterprising merchants in many cities, however, have introduced various methods to facilitate shopping. Some offer free parking service in large public garages near their stores. Others employ

special drivers to park cars for women shoppers. Many others make shopping conditions within their stores as attractive as possible to meet competitive conditions.

Managers of important chain store systems are emphasizing the box office appeal of comfortable and healthful air conditions in stores because American women are conscious of good air as never before. They have found that there is a direct relation between volume of sales, efficiency of employees, the attitude of the public and air conditions. Vitiating air with disagreeable odors must be carried out and a new supply of clean, humidified air pumped in. That's why progressive merchants are using cooling systems as much as theatres for the warm seasons. They have found that the ventilating fan can be translated into terms of the sales slip and the cash register, the merchandising experts declare.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

REVIEW SURVEY OF SINGLE DWELLINGS IN PHILADELPHIA UNDER PERMIT DURING 1924, 1925, 1926

"New single dwellings in Philadelphia are being absorbed by buyers and renters at a more rapid rate than previous surveys have indicated" is the statement made by the Philadelphia Housing Association based on a survey of over 27,000 houses constructed during the past three years. These dwellings were all one family, brick and stone, in operations of four or more. The smaller jobs of permits of less than four were so scattered that the Association deemed it unwise to include them in the study.

1530 CHESTNUT STREET

PHILADELPHIA, PA.

Race 6108-7109

Rittenhouse 9771-2

This survey showed that on September first, over three-fourths of all such new housing occupied by either buyers or renters, and the remaining 23.5% was vacant.

30721 Dwellings Planned During Three Years

Permits issued for new housing of this type during the years 1924, 1925, and 1926 showed plans for 30721 single dwellings. The Association's investigators visited 27034 of these, and found 26059 completed, and of this number all but 6028 were occupied.

If this ratio prevails through the entire city, it appears that of the total number planned during the last three years, less than 22% are now unoccupied and there are only 1125 houses where construction has not been completed.

Indicates Wholesome Situation

This survey reveals a more wholesome situation than has been indicated by the annual studies which the Association has made at the close of each of the past five years, and points to a slow but steady absorption of the new dwellings being placed on the market. This is shown by contrasting the figures for the three-year period with the results of the survey made at the close of 1926, which covered only the dwellings under permit during that year. The study for this period showed about 50% of the total accommodations completed and less than 25% occupied. The results of the three-year survey made nine months after the 1926 study show that 89.8% of the houses under permit during that year are now completed and 50% occupied; the 1925 construction now

shows 97.9% completed and 78.3% occupied; and the 1924 constructions now shows 99.1% completed and 88.7% occupied.

Richmond and Bridesburg Have Highest Record of Completion but Low Record of Occupancy

Richmond, Bridesburg, Roxborough and Manayunk have the highest records of completion of all sections in the city, i. e., 100%, while the central city has the lowest, 85%.

Central West Philadelphia with 91% shows the greatest number occupied, with Manayunk and Roxborough (88%) following.

The poorest records of occupancy are found in Lawndale and Somerton, 54%, with the next lowest in Richmond and Bridesburg.

Completion and Occupancy Summary

Brick and Stone Dwellings under Construction Permit 1924, 1925, 1926

Survey of September 1, 1927.

**"ANTI-HYDRO" Keeps
this Huge Warehouse
Dry**

UNIT C, ARMY SUPPLY DEPOT, CHICAGO, ILL.

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent*. Twenty-three years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through*, instead of a thin surface coating. Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

HEALTH AND THE CONSTRUCTION INDUSTRY

A Talk Before the Convention of the National Safety Council by CARL A. WILZBACH, M. D., *Ferro Concrete Construction Company, Cincinnati, Ohio.*

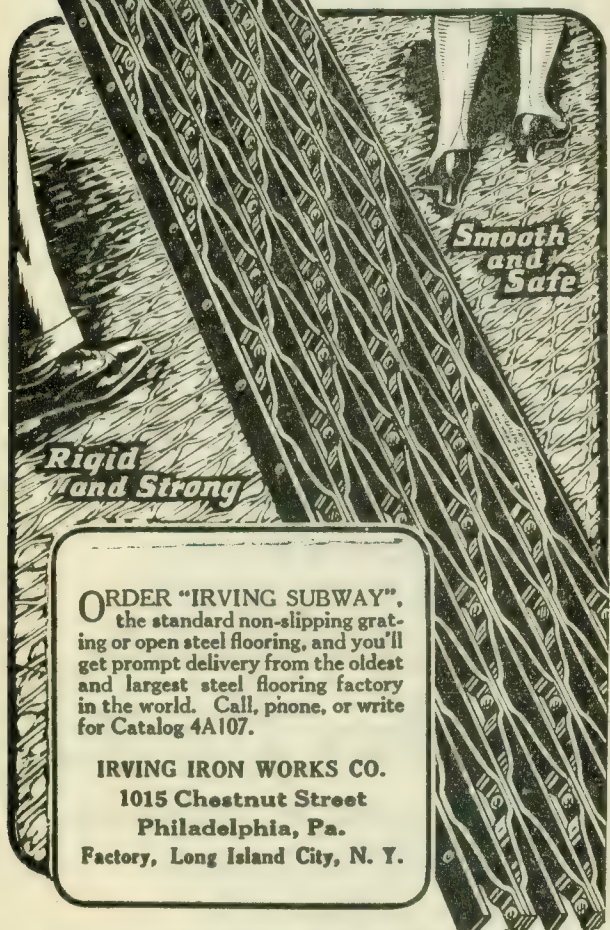

Health in the construction industry may not be different from other fields of endeavor and yet there are certain factors that favor and others that disfavor the health of the construction worker. The worker is usually a rather healthy individual to begin with, made so by the natural processes of elimination. Only those who are able to withstand the physical effort, as well as the effects of the out-of-doors with its varying weather conditions can remain long at his work. It is not a task for weaklings or soft muscled individuals as can be testified by any who have watched the progress of a construction job.

On the other hand, there are many who start young in years and in good health who become expert, efficient workmen—valuable to the company, who over the years acquire all the usual ailments which result in ill health and poor production. At this period the need for medical examination and advice on hygiene is evident and valuable to the men as well as to the company.

We are told by reliable men who have gathered statistics that 3.5 per cent of the 38 million people gainfully employed in the United States are constantly ill and disabled, and of this number half remain on the job. This means that over 1,300,000 workers are ill at any given time. It is further estimated that at least half of this illness is preventable.

Those workers who are ill and still remain on the job furnish us a real problem and an opportunity for it is generally recognized today that there are degrees of health. It is not just absence from disease. It is not present when one is just

able to do his daily work. Health expresses itself in satisfying work, in the ability to enjoy play and recreative activity, in the desire to co-operate with those about one in a common cause.

On the contrary, the worker who is in a low degree of health does not react normally and is apt to be surly, his attitude on questions to be decided is not what might be expected of one in a happy state of health, and there is many times an unwillingness to co-operate. Altogether, this individual is not fit and efficient physically and, therefore, not a good workman.

The average health span or period of physical freedom and full vigor after maturity is between the ages of 18 and 31. That is to say, there is only 13 years after maturity on the average that the worker is free from disease. The work span, or period when men can compete in industry on a fair basis of equality is from 20 to 40 years. This fact is demonstrated by the great falling off in the number of men in industry about the age of 40, at which age their years of productive usefulness seems to be over.

I am sure that all will agree that these periods are far too short, especially when one remembers that the life span at the present time is about 58 years. The rapid accumulation of physical defects, the rapid lowering of physical resistance and working capacity with advancing years, reflect conditions and processes that should be controlled by the application of intelligent care of the body and rational adjustment to work.

What are some factors that influence health? We admit the influence of heredity and pass on to those causes that can be changed and helped during the life of the individual. It is a generally accepted view today that the body does not simply wear out; it is infected out, poisoned out, starved out, or deficienced out. A condition is produced in the body which changes it chemically. In disease there is a tendency toward acidity and death is said to result from acidosis. The factors

that produce the above conditions have been combated successfully in dealing with lower forms of life and much can be done to help man in his fight for a longer healthier existence.

Infections, acute and chronic, lead the list as the most potent cause of disease, the epidemic infections being chiefly responsible in the early years of life; but chronic infections later appearing as a tremendous pathological influence, this type of infection working insidiously and radiating from foci in the teeth, tonsils, middle ear, nasal sinuses, prostatic urethra, gall bladder and appendix.

This condition is evidenced by the man on the job who reports to the physician with a sore throat. On examination he is found to have an acute tonsilitis. This condition is followed by vague pains in the joints some weeks later and then still later by dizzy spells, headache and dyspnoea, resulting from a definite cardiac involvement, all caused by infected tonsils. High blood pressure, nephritis, even gastric ulcers, may be promptly relieved after the removal of an abscessed tooth. Careful attention to the nasal sinuses will frequently clear up a chronic upper respiratory affection which may have long been suspected of being a tubercular condition. It pays to search long and earnestly for some foci of infection especially in individuals who do not respond normally to the accepted treatment.

Food deficiency is still a big factor in the health of men in the construction industry. While the standard meal of the worker, consisting of meat, bread and potatoes is still being seen as one goes among the men, there is also seen green vegetables, fruit and milk. We have seen the great value of the accessory food elements (vitamines) in feeding children, but there is also need for educating the worker to the great need of a mixed diet, including the mineral, vitamine, amino-acid and regulating foods. The effects of diet on certain diseases has been known for a long time, but the newer knowledge of nutrition indicates that many other dis-

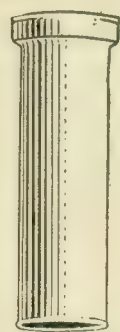

eases are also caused by a lack of certain food elements. It is urged by these experts on the study of foods that there be included for adults daily a mixed diet that contains at least a quart of milk, leafy vegetables and a certain amount of raw vegetable food. If these principles are adhered to the remainder of the balanced ration can be derived from milled cereal products, tubers, root vegetables, sugar and meats.

Poisons are a factor in the health of the worker. The physician has educated the average individual to the need of avoiding constipation, but the number of men is surprising who are taking daily some form of purgative. The various drugs used as cathartics plus all sorts of proprietary preparations are being used. It is questionable what effects some of these drugs generally used will occasionally have upon the body when taken daily and over a long period of years.

Headache tablets are also quite generally used and it is no uncommon sight to see the worker on the job with his box of aspirin tablets which he takes as regularly as he does his meals.

Tea, coffee and tobacco also come under the heading of substances which may poison the individual. Alcohol is increasingly being found to be a factor in producing poisoning. Aside from the chemical impurities contained in the poorly made moonshine there has lately been found copper in quantities large enough to produce metallic poisoning and over a long period of time cirrhosis of the liver.

There is also a need for the man in construction industry to have an oppor-

tunity to relax after his day's work. The speeding up of the worker has increased the strain both physically and mentally and this often results in an over-fatigued individual who is not fit for the job. Recreation and hobbies that lead to different channels of thought and action are needed by men in industry just as much as they are needed by men in other walks of life. While there are exceptions, the average construction workers need exercise as does the clerk or business man. A man who merely stands is not exercising and if he does not stand or walk properly the slight amount of exercise he gets moving about the job makes insufficient call upon the heavier muscles. This fact can be demonstrated by a physical examination which shows how woefully deficient the muscular development is and how high the percentage of physical defects is in the average construction worker.

In this same relationship comes the question of sleep. There seems to be an increasing number of cases of insomnia among the workers. There is at first just an occasional sleepless night. These gradually increase in number, and before long the strain of work plus the loss of sleep becomes too great. All sorts of malconditions result, chief of which is stomach symptoms with indigestion and loss of weight. There can be no doubt that the push of modern construction plus the worry of paying for the car and the newly purchased home are some of the major causes of these conditions. Fear, grief and emotional excesses are most destructive to the health of many workers.

There should be special effort made to stress the need of at least eight hours rest for all workers and more if one is below par physically.

Lastly, there is the problem of malfunction of the endocrine secretions. A complete statement of the effects of the various hormones in health is beyond the scope of this paper. It is generally recognized that these substances do stabilize the body tissue and help maintain a normal state of health.

In closing it seems evident that progress is being made. The average worker is better paid, has more of the luxuries of life, is more intelligent, enjoys a better health state and lives longer than at any period in American history.

But we must advance. There is no reason why the present health conditions can not be improved. "Health, vigor and working capacity" are not functions of time, but physical states influenced by what happens in the course of time. Neither the life span nor work span of mankind is fixed by any law. It is within the power of man's intelligence profoundly to influence the length of these spans. To this end we must work with full vigor and driving force.—*Building Industry*.

COMPLETES RECORD FOR CONCRETE WORK

Frederick Massiah Erects Ten-Story Re-Enforced Frame in 69 Days

With the completion of the concrete skeleton of the first unit of the \$10,000,000 Walnut Plaza Apartment building at the southwest corner of 63d and Walnut streets, Philadelphia, a record was established for the re-enforced concrete work. The structure, which is ten stories, on a site 262 feet by 148 feet, building measurements, was completed in sixty-nine days, insofar as the concrete work is concerned. Frederick Massiah, Philadelphia, engineer and contractor, held the contract for this phase of the development.

It is understood that the contractor had a contract from the builders, Armstrong Latta, of Philadelphia, with a limited clause in it, specifying that the work had to be completed within a certain number of days. A bond also was necessary, as is the case with big developments guaranteeing that the work had to be completed at a certain date.

This necessitated the hiring of a small floating population of an average of 250 men per week. They were employed in all phases of concrete work, and their work at times was so rapid, and the progress of the development moved with such exact precision, that it was often necessary to send rush calls to the steel mills for more steel. These 250 men, under the leadership of Mr. Massiah and his foreman, used thirty-eight carloads of materials each week, and every six days there had to be two carloads of steel delivered on the job. All told, there are 700 tons of steel in the first unit of the development.

The entire project will be a block long from Cobbs Creek Boulevard to 62d street. There will be four units, with a massive underground concrete garage in the center, sunken in such a manner that it will be covered with a well-appointed terrace, dotted with shrubbery. The owner is Louis M. Lifter, and the architects are Stetler & Deysher, of Philadelphia.

During the course of constructing the concrete skeleton, a class of engineering students from the University of Pennsylvania visited the development to study the methods of the contractors. Among other developments of which Mr. Massiah was the concrete contractor is the new Browning-King building at 16th and Chestnut streets and the sixteen-story apartment building at 19th and Panama streets. The only elliptical concrete dome in the United States, which graces the Church of the Ascension of Our Lord at F and Westmoreland streets, was built by Mr. Massiah.

THE WELL-WIRED HOUSE SELLS

By B. BADRIAN, *Society for Electrical Development*

Everybody wants the full benefit of electricity in the home. Where is there a family that does not enjoy its bright toaster, its cheerfully gurgling percolator and its waffle iron? Lives there a woman who would do without her electric suction cleaner? Or a man who doesn't care about a good, comfortable reading lamp that can readily be placed just where he likes it? Yet this universal desire for the easy use of electricity can be gratified only in well-wired homes. Such homes are astonishingly few, as renters and buyers are learning to observe. There is something in this for the speculative builder to consider.

It is a fact worthy of any builder's attention that every family frets and fumes almost every day because troublesome wires have to be strung around the breakfast table in order to give the toaster, the percolator and the waffle iron their chance. An electric lamp has to be awkwardly unscrewed from within its glass or silken shade in order to attach the suction cleaner for its morning round of the rugs. And in the living room there is almost no place at which to connect the comfortable evening reading lamp unless some other lamp is removed.

How often, even in these days of advanced ideas about electric service, do husbands and wives talk it over!

"My goodness, George," says she, after a strenuous day, "it certainly is troublesome to have these electric cords lying across the floor to reach the bridge lamps. Someone is always tripping over them."

"Why don't you run them under the rugs?" he proposes.

"Well, if I do, then the rugs wear out fast in strips right where the wires lie. I can hardly run the cleaner over such places. They just make a rug wad up, and everyone is always scuffing their feet over them. It worries me all the time."

"Can't you attach one to the baseboard socket?"

The table lamp uses that. It's too bad there aren't more sockets in that room. Why, we ought to have at least four in there to take care of the bridge lamp and the table lamp and the one by the piano and the other one back of the davenport. And I do wish we had a wall socket like Mrs. Grantham has beside the door between the living room and the dining room. She can plug in her cleaner without even leaning over and then it will reach both rooms."

They both look around the rooms a minute. Then:

"When we moved in here," says he, "they told us this place was well wired. I thought so, myself. It's better than our last one, at that, for we didn't have even

one baseboard socket before. But, gee whiz, after I got those electrical things at Christmas-time—. It doesn't seem as though there has been any chance to use them, does there?"

They both wonder whether they'll "ever live in a really good house that hasn't got anything the matter with it" and remark to each other how fine that would be.

Right there is the speculative builder's opportunity. He is forever struggling to find ways of making his houses and apartment buildings better than his competitor's without great expense to himself. He hungers and thirsts after a sales argument that will give him a selling edge.

Adequate wiring is just such an argument. If he builds homes that guarantee the occupants against having to drape a tangle of wires around breakfast tables and against other awkward expedients to get electric service, then he has something to sell that will make a strong appeal to tired house hunters. Everybody wants to enjoy the full benefit of electricity and he can capitalize on that perfectly human and laudable desire. His properties become not only more salable, but take on a higher permanent value.

"But," this builder may say, "how can I make the wiring in my homes speak for itself? To my average prospect, all wiring appears to be about the same. How can I make my wiring show its superiority?"

That is where the National Red Seal Plan suggests itself. When a house or apartment building is wired according to Red Seal specifications, a label is affixed by inspectors on some part of the wiring. It is the same as the "Sterling" mark on silver. It stands for adequacy. It is the proof of wiring convenience. The builder who can display it in a house has a dramatic selling point in his favor.

The Red Seal Plan of house wiring is one which has been worked out by years of experience and which represents neither the maximum of wiring possibilities nor yet the minimum, but which provides the occupants of a home with adequate lighting and other electric service. Outlets are sufficiently plentiful and wiring equipment is so planned as to permit easy, natural, convenient use of electricity. Standard wiring devices of any manufacturer can be used.

Anyone may be sure that wiring bearing the Red Seal is adequate. In a house thus wired there will be no obstacles in the way of convenient use of electric appliances and lamps. The owner of a dwelling pays nothing for the use of the Red Seal idea. If he builds in a territory where the Red Seal plan is operating he specifies in his electrical construction contract that he wants a Red Seal job and, after the work is completed, an inspection

is made for him so as to establish the fact that the wiring merits the award.

The Red Seal specifications represent the combined thought of all the elements comprising the local electrical interests as to what constitutes a minimum of requirements for an adequate wiring installation. For a building to receive the Red Seal, the wiring must be in accordance with the Red Seal specifications. As a prerequisite to awarding a seal, the installation must also meet National Electrical Code, or equivalent, requirements. Thus Red Seal wiring, is both adequate and safe wherever it is found.

This plan is national in scope and is sponsored by the Society for the electrical industry and in turn for the public. This organization, which is non-profit and non-partisan, is consecrated among other things to the work of informing the American public of the many advantages, both economical and practical, of making use of electric service in its many forms.

The method of operating the Red Seal plan, which is fully copyrighted and protected by The Society for Electrical Development, is through local electrical organizations which set up the local wiring standard that is practical for all purposes. This standard is always a marked advance over the inadequacies which obtained previously. The Society takes especial pains to see that these local agencies have the facilities to do a 100 per cent job in the interest of the public and incidentally in the service of the building interests which gain in a very definite manner from the proper operation of the plan.

It should be remembered that the Red Seal plan deals only with the adequacy of the wiring installation. That is to say, it is concerned with the installation of a reasonable number of lighting outlets and switches and convenience outlets from which can be operated portable, table, and floor lamps, and electric labor-saving devices safely controlled. The local organization receives a license to operate the plan from The Society for Electrical Development and from time to time reports are made and a definite check-up is instituted to see that the plan is being operated in conformity with the strict rules and regulations controlling it for the best interests of all concerned.

Red Seal emblem posters are used to identify the home to be wired according to Red Seal standards both during construction and after it is completed. When the home is occupied the posters are removed and a final mark of identification in the form of the label—the Red Seal emblem—is affixed to some convenient and conspicuous part of the electrical service equipment and the home owner is presented with a Red Seal certificate which forms part of the deeds to the home.

This plan, which has been spreading through the United States for two years, is making the Red Seal well-known in nearly a thousand cities and towns where the plan is now operating. About one-sixth of the population of the United States live in these communities and more territorial groups are included with each passing month.

Early in 1927 the principal cities from which Red Seal operation was radiating were these:

Syracuse, Rochester, Buffalo, Poughkeepsie, Amsterdam, Schenectady, Saratoga, Albany and Elmira, N. Y.; Pittsburgh and Scranton, Pa.; Chicago, Waukegan, Rock Island, Moline and Peoria, Ill.; Louisville, Ky.; Detroit and Grand Rapids, Mich.; Minneapolis and St. Paul, Minn.; Atlanta and Savannah, Ga.; Denver, Colo.; Tulsa, Okla.; Memphis and Chattanooga, Tenn.; Youngstown and Toledo, Ohio; Milwaukee and La Crosse, Wis.; Providence, Woonsocket and Pawtucket, R. I.; Muncie, Ind.; Davenport, Iowa; and various cities in California, including San Francisco, Oakland, Sacramento, San Jose, Stockton, Fresno, Los Angeles and San Diego.

Other cities and towns have already applied through leagues and other representative electrical group for licenses to operate under the plan. Although the idea is still young, it has so satisfactorily met the need for a uniform standard of wiring that the time will soon be here when it will be possible for any building anywhere to secure Red Seal wiring.

With our modern facilities for efficiently wiring homes, development houses ought not to be poorly wired.—*Building Developer.*

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Repetition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—*Making advertising pay.*

write practically every form of Insurance, except life*

BUILDERS' RISKS ARE MANY

but the cost of protection is trifling.

Don't let a fire, windstorm, or some other eventuality catch you with nothing to defray your loss.

Any North America Agent will be glad to give you full information and advice on this form of insurance, without obligation.

"ANTI-HYDRO" Prevented Concrete from Freezing in this Building

This building was erected during the winter months. The temperature ranged from 30 degrees down to below Zero.

By using "ANTI-HYDRO" in the concrete, no delay was caused by extremely cold weather. Concrete was poured without freezing on days as cold as 15° F.

"ANTI-HYDRO" was used throughout the mass in the concrete foundation walls, basement floor slab below grade, boiler pit five feet below basement floor and for hardening and waterproofing all concrete floors throughout the building.

All concrete in foundation walls and floor was poured against a 4 foot head of water. "ANTI-HYDRO" accelerated the set of the concrete so that this water condition was easily overcome.

In addition to lowering the freezing point of concrete, "ANTI-HYDRO" also hardens and waterproofs cement mixtures—all in one operation. It is extremely easy to use. Mixes readily with the gauging water without the aid of skilled labor.

"ANTI-HYDRO" has been in continuous use for 23 years. It is the oldest liquid integral compound in existence. Use it on your next job for guaranteed results.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Public School, Millsboro, Del. Owners, State School Building Commission, George S. Williams, chairman, Dover, Del. Contract awarded Farmville Mfg. Co., Farmville, Va., \$24,800. Electric awarded Farmville Mfg. Co., Farmville, Va. Plumbing and heating awarded L. Morgan Sons, Salisbury, Md.

School Building, St. Charleston, West Virginia. Architect, Henry L. Reinhold, Jr., 1632 Walnut street, Philadelphia. Owners, Board of Education, South Charleston, W. Va. Contract awarded Asbestos Building Co., Liberty Title & Trust Building, Philadelphia.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., November 29, 1927. Sealed bids will be opened in this office at 3 p. m., December 28, 1927, for enlarging money order and registry division at the United States post office building, New Brighton, Pa. Drawings and specifications may be obtained from the custodian, or at this office in the discretion of the supervising architect. JAMES A. WETMORE, Acting Supervising Architect.

Repetition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

CONTRACTORS

Inquiries on prices for
**CAULKING or CAULKING
MATERIALS** addressed to
S. LIBMAN, should be sent
to Post Office Box 33, Philadelphia,
Pa., or phoned to Evergreen 2473.

Yours for Service,

S. LIBMAN

or some other eventuality catch
you with nothing to defray
your loss.

Any North America Agent
will be glad to give you full
information and advice on this
form of insurance, without
obligation.

"ANTI-HYDRO" Prevented Concrete from Freezing in this Building

This building was erected during the winter months. The temperature ranged from 30 degrees down to below Zero.

By using "ANTI-HYDRO" in the concrete, no delay was caused by extremely cold weather. Concrete was poured without freezing on days as cold as 15° F.

"ANTI-HYDRO" was used throughout the mass in the concrete foundation walls, basement floor slab below grade, boiler pit five feet below basement floor and for hardening and waterproofing all concrete floors throughout the building.

All concrete in foundation walls and floor was poured against a 4 foot head of water. "ANTI-HYDRO" accelerated the set of the concrete so that this water condition was easily overcome.

In addition to lowering the freezing point of concrete, "ANTI-HYDRO" also hardens and waterproofs cement mixtures—all in one operation. It is extremely easy to use. Mixes readily with the gauging water without the aid of skilled labor.

"ANTI-HYDRO" has been in continuous use for 23 years. It is the oldest liquid integral compound in existence. Use it on your next job for guaranteed results.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

MAKE YOUR PLANS FOR THE FUTURE WHEN YOU BUILD YOUR PLANT

BY MORITZ KAHN

Of Albert Kahn, Incorporated, Detroit

Reprinted by special permission from
"Factory, the Magazine of Management"

When a manufacturer starts to build a new plant, he looks into the future to picture, if possible, how he will be impressed by the layout of his works 10 or 20 years hence. And in this he is right, because the general scheme of a plant should not be one which merely takes care of present requirements, without concern for the future development of the industry.

Careful thought needs to be given to problems of expansion which will arise as the business grows, in this way making certain that the manufacture will always be carried out efficiently, no matter what

stage of development has been arrived at in the construction of the plant. Industries are intended to succeed; success involves growth; and every well-arranged scheme will take into consideration the future extensions necessitated by such growth.

An ideal plant may be likened to an expanding library made up of sectional bookcases. As the library grows, new sections are added; it is always complete, yet always allows for the addition of further sections which, eventually, form one preconceived, coherent scheme. The same results can be obtained with the buildings of a manufacturing plant, provided due consideration is given to future developments, and provided the buildings are erected to standardized dimensions and details. The final desire effect can be procured with a minimum of inconvenience to the owner in the way of disorganization of his plant and at a cost which will not prove excessive.

Failure to make arrangements as herein outlined has, in many cases, been the causes of the poorly organized plants one sees only too often throughout the country. The manufacturer who builds only for the present later on finds it necessary to add wings or sections here and there as the occasion arises, and without a predetermined plan he eventually develops a group of buildings which bear no relation to each other. In the end he is possessed of a plant which is essentially disorganized, and it is needless to point out that such a plant cannot be operated under ideal conditions as regards supervision and economy of production.

It is a simple matter to obtain the desired result if the development of a plant is properly started. In selecting a site, one of the considerations should be the possibilities of expansion—the site

should prove large enough for many years' growth. The architect should thereupon prepare preliminary designs showing, in outline, a grouping of buildings which will meet with the manufacturer's requirements as far as they can be foreseen for a period of many years. Obviously, the immediate construction of such a group of buildings would involve extravagant cost. Construction need only be started on such a portion of the scheme as will suffice for the immediate needs. With the growth of the industry, portions of the original plan can be constructed periodically, all the additions aiming at the final goal, as originally planned. With this method of development it matters little when and where construction ceases. The various buildings of plant will then always be systematically arranged and will still permit of systematic extension. A commendable feature of this method of procedure lies in the fact that it entails no extra cost. In truth, economy will result, for this procedure eliminates the possibility of constructing buildings which might stunt the future growth of the industry or, on the other hand, which it might be necessary to remove in order to permit such growth to take place.

The method of development as above outlined refers principally to the horizontal growth of a plant. Factories can grow vertically as well as horizontally where multi-story buildings are concerned. When originally constructing such buildings it often proves advisable to lay foundations which are strong enough to support a number of floors greater than the number immediately warranted. For example, a two-story building could have foundations strong enough to support four extra floors. With the growth of the industry the extra floors can be added without disturbing the operations that are taking place on the lower floors.

It is true that this arrangement for the construction of multi-story buildings entails a slight extra initial investment, but this investment is certain to bear fruit. And the safety factor involved is worth much more than the risk taken in the extra investment.

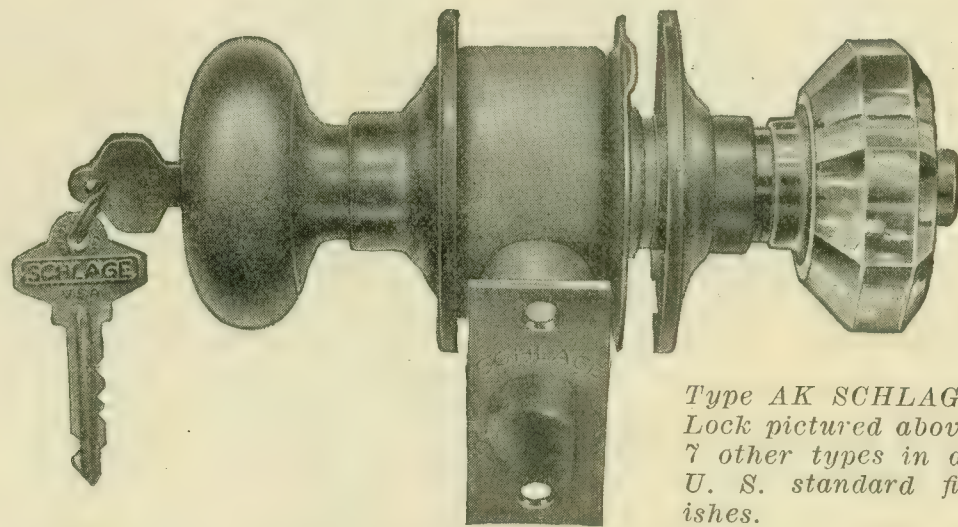

In the layout for Plant No. 6 of Dodge Brothers, Detroit, Mich., to meet present requirements, it was necessary to construct only a portion of this scheme: the first unit, which consists of a building, 1,962 feet long by 257 feet wide. The first unit was constructed merely for the assembly of cars. The entire development contemplates the eventual manufacture of parts to be assembled in the present unit. It allows for extending the building 120 feet to the west and 225 feet to the east. The total floor area of the present unit is about 502,000 square feet. The entire development contemplates 2,160,000 square feet.

The merits of this plan require no elaboration.

With a preliminary design as herein described before him, the owner rests assured that as the necessity arises his plant will grow towards his pre-arranged scheme, and no matter when he stops building he will always have a systematic grouping of departments which will lend itself to economical production. In the end he will be possessed of a plant which is worthy of the efforts put into its development.

This is the second of a series of articles by Mr. Kahn. The third will appear in an early issue.

"20th Century Advertising," by George French, is a book of particular value to all those engaged in the field of advertising. It is instructive and entertaining reading, however, for any one interested in the studies made in the business world during the last quarter of a century, for as Mr. French says in his introduction: "The longer I study advertising, and the more knowledge I acquire about its operation as a business factor and a sociological phenomenon of the greatest consequences, the clearer it seems to me that it is the great motivating force in business and people depending upon it for the support of life. This places advertising in

the position of an element *in life that makes life possible.*" . . . Or, as he later puts it, "Advertising undertakes to function between business and us, who are the ultimate consumers."

Although advertising had existed and given signs of promise long before the 20th Century, certain vitally important developments have occurred since that time. As Mr. French tells us, the idea of Truth in Advertising was "Thrust into organized advertising at the first vital meeting of the Associated Advertising Clubs of America held in 1906 at St. Louis."

Mr. French points out the great differences between European and American advertising methods, and gives many interesting examples of advertising technique, a number in color and accompanied by illuminating criticisms and comments. In fact, this book deals in its 44 chapters with every phase of advertising, and the whole subject is reviewed in a thoroughly interesting and understandable manner.

"20th Century Advertising" should certainly prove invaluable to the forward-looking business man of today. D. Van Nostrand Co., 8 Warren St., New York City, are the publishers. Price, \$6.00.

UNITED STATES CIVIL SERVICE EXAMINATION

The United States Civil Service Commission announces the following open competitive examination:

PRINCIPAL ARCHITECTURAL AND STRUCTURAL STEEL DRAFTSMAN

Applications for principal architectural and structural steel draftsman must be on file with the Civil Service Commission at Washington, D. C., not later than December 27.

The examination is to fill vacancies in the Lighthouse Service, Department of Commerce, throughout the United States, and in positions requiring similar qualifications.

The entrance salary is \$2,100 a year. A probationary period of six months is required; advancement after that depends upon individual efficiency, increased usefulness, and the occurrence of vacancies in higher positions.

The duties, under general supervision, are to perform difficult freehand or architectural and structural steel drafting, requiring judgment, skill, and a thorough knowledge of the customs and practices of the drafting occupations in expressing ideas, plans, and data in drawings; or to supervise the work of a group of draftsmen of lower grades.

Competitors will not be required to report for examination at any place, but will be rated on specimens of drawing to

be filed with the application; and their education, experience, and fitness.

Full information may be obtained from the United States Civil Service Commission at Washington, D. C., or the secretary of the United States civil service board of examiners at the post office or custom house in any city.

NEW COMMERCIAL LIGHTING UNIT COMBINES HIGH EFFICIENCY WITH ART AND DECORATION

By ROGER A. LEA

The demand for ornamental commercial units has resulted in a new type of lighting unit which combines the totally enclosed and exposed ball lamps in an unusually attractive manner. These units are obtainable in a great variety of sizes and styles. There are almost one hundred different ornamental variations to choose from.

The architect and dealer now have available these stock units which can be specified and installed with satisfaction on jobs where special lighting equipment would be too costly. These units thus fill the gap between the standard catalogue types and specially designed fixtures, the former often being too plain or uninteresting, the latter too expensive.

Authentic classic ornamentation has been applied to these units in such a way as to be in keeping with the average interior decorative scheme. Both Gothic and Romanesque designs can be furnished on any of the decorative types.

Shapes of glassware are usually limited as to depth because they are made for use with a ceiling hanger in which a two-piece receptacle is necessary. The long graceful curves of this new globe were laid out with the ceiling as a base for the design. This feature of beauty has been recognized by nationally known architects and decorators who are specifying this unit.

These long curves are responsible for the greatest feature of these units—the highest degree of efficiency ever attained in an enclosed globe. Tests on all five sizes show an average of 90% light output; more than is attained through the highest grades of double or triple cased glass or prismatic glass.

These units produce no shadows on the ceiling, whether a ceiling fitter or pendant type is used. This is due to the light distribution being general. No shadows appear on the glass itself, nor does the ornamental ring cast a shadow. More light, however, is thrown in the bottom plane by this unit than by a bare lamp, amounting in some sizes to 6% more downward light.

While thus flooding the space beneath with an efficient light, plenty of light is provided in all directions. The light

thrown upward by the unit brings out the height of the room in which it is used without producing the usual objectionable ceiling shadows.—*Building Industry.*

Desirable desk space, in a centrally located show room, will be leased to a desirable tenant at a reasonable rental. Privilege of displaying samples will be given with the space rented. Inquire B. G. 1000.

Construction operations continued their record-breaking tactics during November by establishing a volume never before equalled in that month of any year, according to statistics compiled by the Associated General Contractors of America. The amount of work handled by the construction industry during recent weeks has served to increase the leadership which the current year holds over 1926. The volume of operations recorded for the first eleven months of 1927 is five per cent greater than the figure registered for the corresponding period of last year.

These statistics representing all types of construction, are based upon actual shipments of construction materials.

Operations last month were slightly smaller in volume than those of October. The fact that the decline was small is being accepted as indicating an increase in the practice of carrying on construction work despite cold weather.

December is expected to witness a scale of activities unusual for that month of the year. This expectation is based upon the fact that the volume of contracts awarded during October showed a large increase and established a record never before equalled by that month in any year. The volume of contracts awarded during the first ten months of 1927 exceeds the corresponding figure registered for 1926 by three per cent.

A scale which places the 1913 average at 100 as its basis shows the index number of November's volume of actual operations to be 215. Similar figures for other months of 1927 are: January, 129; February, 121; March, 135; April, 165; May, 197; June, 212; July, 221; August, 238; September, 236; and October, 222.

The average of construction costs showed a slight decline during last month, lower prices commanded by common brick and hollow tile in several construction centers being responsible. The average of wages remained unchanged during November, this being the tenth successive month to see this situation prevail.

Men are walking by and around people that want to buy from them, and do not know it. The DAILY BUILDING NEWS will tell you who wants to buy your products.

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

Lehn & Fink Building, Bloomfield, N. J. Buchman & Kahn, Archts. Chas. R. Hedden Co., Contrs.

This entire building was constructed between November and February with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water, making it possible to continue concreting, cementing and masonry work during freezing weather and finish your contracts on time with prompt payments for completed work.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also permanently hardens and waterproofs concrete all in one operation. It mixes readily with the gauging water without the aid of skilled labor. During 23 years of continuous use "ANTI-HYDRO" has never failed to live up to the claims made for it. Satisfactory results are guaranteed. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

To all our subscribers, advertisers, friends, we extend the Season's Greetings—first thanking all for the support given us during the year and expressing the hope that all whom we have served have profited by using our services.

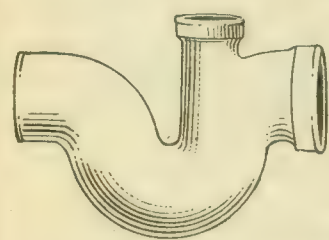

Business has not been the best for everyone in the architectural and building trades, but there have been years when conditions were not so good as this year. Of course, prices have not been quite so satisfactory, but the volume of business has held up almost to former years and the outlook for the coming year is very promising.

"Business is picking up. After January 1st it will be still better. Prospects are excellent," says Charles M. Schwab. These predictions coming from a great leader in business make us feel more confident about prospects for the coming year and help to assure prosperity and happiness, both of which we sincerely hope will come to all the architectural and building trades.

CONSTRUCTION DESTRUCTION AND RECONSTRUCTION

Address delivered by A. K. BAYLOR, of the General Electric Company, Before the American Construction Council, St. Louis, December 2, 1927.

I feel some diffidence in addressing the American Construction Council. Its ramifications through the various interests represented are so far-reaching that to merely list them without comment would fill quite a volume. On being invited to speak here, my first thought was to deal with some phase of construction directly related to the electrical industry, but after I had devoted some time to better acquainting myself with the form, purposes and major activities of this organization I found greater interest in considering the principles that brought the Council

into existence and touch broad national problems. Some of my thoughts may appear far afield from the immediate business of this meeting, but they are not I believe remote from the ultimate purposes of the Council. So I ask your indulgence; especially as your President is directly responsible for inspiring the trend of my remarks.

In his message to your Fourth Annual Convention, Mr. Roosevelt said:

"This after all is the heart of the American Construction Council movement—that progressive measures on the part of the construction industry shall be taken, and its ills, when they exist, cured not by governmental and court action, but by voluntary work of the industry itself. It is this that marks the movement as one of the big forward steps in American industrial organization."

Here is a keynote worthwhile not only for this group of industries, but all industries, communities and individuals; a universal chart to safe harbors.

In considering the varied work of the Council five activities appear to me of outstanding importance:

Better, and more permanent building, particularly as applied to homes. City and town planning.

The avoidance of seasonal peaks in building operations.

Extension of highway construction of improved character.

Financial practices as applied to construction work.

Your pamphlets on better buildings, especially dwellings, are convincing and startling. Evidently much of this construction is shoddy and unlikely to survive the mortgages that rest on most of it; and inadequacy is also apparent, especially in the cities.

Living, as I do, in a big city, I wonder what is to become of us under present tendencies. Tenement conditions grow more congested, and apartments less and less adequate in basic facilities; resembling tenements outwardly veneered. They spring up almost overnight, live their short day and are wrecked to give place to larger and higher ones (but lower studded) to house increased population with reduced accommodations and, of course, higher rents; as unamortized pre-

vious investments on the sites must be capitalized.

There is, moreover, no appreciable tendency by arcading, tunnelling or utilization of inner courts of skyscrapers, whether apartments, office buildings, hotels, stores or lofts to take the concentrated traffic they create away from already overcrowded streets.

It would appear that this sacrifice of office, store or living space at the ground level would be more than offset by enhanced value through convenience to the occupants of the building itself, without taking into account at all the immense public benefit in relief of street traffic congestion. Perhaps conditions will compel such treatment even of existing structures, especially where there are already spacious hallways, foyers or other non-rent-producing areas.

As for transportation during early morning and late afternoon hours, I must literally fight, not only to get on to public conveyances, but to get off again.

Automobile operation in all our cities becomes increasingly impracticable; and yet a presumably enlightened public persists collectively in a practice that subjects it individually to an intolerable nuisance. Neglecting inconvenience and the accident hazard, which are serious enough, there is an economic phase to consider. Everywhere we find the streets jammed with parked cars, rusting and deteriorating from weather exposure, representing vast cash investment—and several times that investment in unliquidated instalment debt. We ride short distances back and forth while vitality languishes for lack of open air exercise; and in many communities street car services, still indispensable to city life, languish for lack of patronage. The wide-spread ownership of automobiles has doubtless been a boon; but their improper use has not.

Surely there are limits to developments that depend not alone on strength of

building materials, but minimum possible living space per individual and mere ground areas. In smaller cities the case is not so bad, but the trend is the same.

It is estimated that over 50% of our

population is in the cities and that this percentage is growing. Is it possible that a stable society can be perpetuated under conditions that, for an increasing proportion of the people, make real home life and the proper bringing up of children a literal impossibility? Life under such conditions is almost entirely and necessarily artificial and humanity in seething masses develops its least admirable traits. Such congestion is a forerunner of national decay; and if posterity is entitled to any consideration, we should try to check and reverse this trend.

I believe the industry I represent will be an important contributing means to that end. Electric power, so universally available, is taking manufacturing into the open places; bringing at the same time modern comforts, conveniences, luxuries and entertainments to the homes that make up new communities thus created as well as to the far-flung agricultural populations. These developments have had as yet only a beginning, but warrant the hope that the movement of population may be reversed.

Meanwhile ephemeral structures grow everywhere like mushrooms and wrecking is a most active, and—I daresay—profitable activity. I have no idea as to what is the national total of investment value destroyed annually in process of wrecking to make way for new structures, but I venture to say the figure is greater on the average than all losses due to earthquakes, floods, tornadoes, agricultural blights, and other so-called force majeure put together. Especially is this true, I believe, if we include on the side of man-made destruction fire losses due to hazards created in mindful defiance of known safeguards.

There is hope of betterment to come from movements in the direction of City and Town Planning and an outstanding example of such planning is to be found here in the City of St. Louis. I wish the time permitted more specific comment on this subject, suggested by Mr. E. J. Russell's paper delivered at your Fifth Annual Convention. I hope we may reach a stage of further national awakening that takes more into account, not only zoning and street re-adjustments, but the detail character and design of buildings in relation to each other and to their environment. We have innumerable instances of structures individually beautiful and serviceable, but quite generally these are submerged and their utility encroached upon by immediate neighbors. Fine examples of the architect's genius are thrown into shadow—and approaches rendered inadequate by towering nondescript piles on either hand that in turn swear at each other architecturally.

May I be permitted in this iconoclastic time to make a plea for beauty? In our

great pressure of industrial activity, considerations of beauty (and other ideals) are often set aside; because there isn't, for the moment, "any money in it." But this is not entirely an idealistic matter. Beauty. Appropriate beauty is a real asset. Environment affects the very nature of a people in the long run. We have the means—unprecedented means—to build not only well, but beautifully; and to a large extent, I believe, we also have the taste; although it is not organized.

In our current operations we are trustees of the future and should begin to think more seriously about it from every point of view.

This means restraint and even sacrifice of some immediate gain in the present—for future benefits; but if we are interested only in "now" we will scarcely leave a mark on the scroll of time—and God help our descendants. The instant "now" as we contemplate it is gone and the past is useful only for the lessons it teaches. Some there may be who will ask "What has posterity done for us?" To them I would say "You are at least interested in the practical economic effect of your present actions upon your own presumptive future years; and in safeguarding those years you will automatically serve the interests of posterity."

As building activity is an underlying factor in the economic index at all times, far-reaching benefit may come from your efforts to level the volume and eliminate peaks and valleys; not merely seasonal, but periodic in terms of years.

Success in this effort will surely tend to check development of booms and panics which have come generally without change in inherent conditions; due to swings in the public state of mind that governs the flow of money.

These recurring ups and downs give constant warning of the dangers of excess; and yet, so short is popular memory and foresight the same errors are repeated with the same results many times during the span of a single generation.

Our land is blessed with an as yet unexhausted and unmeasured diversity, which is the means of balance. It remains for us to apply this diversity and check extreme fluctuations.

There was an inscription on the Transportation Building at the Chicago World's Fair to the effect that "Next to printing the greatest civilizing influence has been the development of facilities of transportation."

In the field of highway improvement, there is vast opportunity for this Council to express itself. There are said to be in the U. S. approximately four million miles of such highways of all types and a great deal of it certainly is destroyed and has to be replaced before reserves against cost of construction have been fairly es-

tablished. As we must have highways at any cost this process if continued will accumulate a staggering debt against the future.

In this connection the menace of economic waste is particularly great; but there is such menace in all bad construction. Yet leaders who maintain quality in materials or workmanship are often at a disadvantage in price competition, although well established reliability costs money and represents real value. Obviously we desire the best at the lowest price; and the only way to get high quality combined with low cost is to give support through volume to quality workers. Some factors of quality are intangible in a finished product or structure. What may be measured by the foot rule—weighed on the scales or outwardly observed—may not be a competent criterion of endurance or even strict suitability for a given purpose. Such qualities are often "buried," so to speak, in the processes of construction and may only be demonstrated by the crucial trial of actual service. The most carefully drawn specification does not insure excellence without the personal factor of the manufacturer or contractor who interprets and executes it. This economic phase is largely in the hands of buyers. If they over stress cheapness, quality and the endurance that goes with it are gradually and necessarily sacrificed.

The lay public is quite dependent upon the construction professions and trades and it is well for the public and much to the credit of these professions and trades that they have organized this Council and are combining efforts in the interest of better standards and practices.

Amongst the literature of your Council that I have studied is the address of Mr. S. W. Strauss, delivered in Cleveland a year ago, on "Financing the Building Industry," and I will not presume to add anything to such an analysis by such an eminent authority. Obviously the question of finance touches the root of every purpose of this Council—or any other, organized for practical accomplishment. The laws of credit are well known and are much older than any of our industries.

Nationally we have much wealth broadly scattered and therein lies a blessing and a danger. While individuals and business organizations are entitled to benefits of reasonable credit for the enjoyment of necessities and comforts of living, or the development of business, the tendency when money is easy is to operate on easier terms. Such laxity encourages looseness that leads to fraud, on the one hand, and loss and distress on the other. Surely the most healthy class of installment buying is in the purchase of homes; but it is no kindness to the purchaser to lead him beyond his depth.

It should be possible through concerted action by banks, surety companies and other financial reservoirs to educate the public and safeguard them and business in general against these dangers; and also to isolate fraudulent schemes so that they may stand out conspicuously in the public eye.

So much for some of the specific activities of the American Construction Council.

* * *

All students of history must be impressed and depressed by the monotonous repetition of the story of nations.

First—their inception, foundation, early struggles, progress, success, ripened growth and strength in varying degrees—the period of Construction. After that the waning of rugged virtues in the higher, leading or governing classes; followed by decay and collapse—the period of Destruction. Then Reconstruction—usually on a modified political basis, but, in whatever form, doomed apparently to repeat the cycle; because subject to unchanging characteristics of human nature—ambition, courage, strength, self-restraint, virtue, under adversity—laissez-faire, relaxation, carelessness, weakness, self-indulgence, vice under the insidious influences that breed most prolifically in the womb of prosperity.

We are young as a nation, but stand at the highest point yet registered in wealth and material strength; with much in our record that is an example before the world and of which we may well be proud.

First there was established here the most perfectly balanced form of government yet recorded in history; at least it was so at its inception. The people at large have had greater encouragement and freedom of initiative than those of any other State have ever enjoyed. As a result we have stimulated research and industrial development, and, more than any other nation, have contributed to the world the benefits of practically applied science and invention; while securing to ourselves the highest world record of average living conditions.

We have distributed wealth through wide-spread employment and high wage scales until nearly 50% of all our people, represented by families, are capitalists—owners of property, securities, insurance policies and deposited cash reserves. At the present rate we will perhaps within a decade pass the 50% mark and become a majority nation of capitalists. Then we will have set up a condition unprecedented in human history under which the majority, in immediate self-interest, will seek to raise, educate and enrich the minority. For the owner of property wants others to be the property owners, so that the rights of property will be more

generally respected. The greatest weakness in all civilizations has been that the majority, having little or nothing, has envied a minority that enjoyed all the better things of life; and, at critical periods, has risen and crushed that minority. Then the mass or communistic idea in turn breaks down because of the irradicable instinct of individual ownership.

I can conceive of no more startling reversal of political form than will result if this tendency is carried to its logical conclusion. The subject has been critically reviewed by Prof. Thos. N. Carver, of Harvard, in a book entitled, "The Present Economic Revolution in the U. S."—which is well worth study.

So we may hold our heads high as to material development up to date. But other nations have grown prosperous and powerful; have had their periods of political soundness; have attained to heights in art and literature that have not been excelled or perhaps, equalled; and yet they have fallen; fallen for lack of wide-spread common interest; and because of the intoxicating influence of their very prosperity and strength.

Then volatile material accumulations have "taken to themselves wings"; and disintegrated, like a bubble pricked.

The question is how much that we now enjoy is inherited socially and politically from our ancestors, and materially from natural resources; and are we dissipating or conserving our inheritance so that it may be passed on not only unimpaired, but enhanced? Are we adding to the the strength of social and political forms that have been the root and fertile soil from which our welfare has sprung; or are we permitting them to be undermined and vitiated? Are we taking all reasonable precautions to conserve natural resources? Are we building well our material structures or are they yielding to the influence of an all pervading "jazz?" Has our curve of fundamental progress a healthy upward trend, or does it lag and even turn downwards in some respects?

In short, are we sound—or, at a faster rate and on an extended scale—merely on the way to repeat the ancient cycle?

In answer to these questions present material wealth is no criterion. On the contrary it is in fact the eternal Lethe that induces complacency and may blind us to swelling adverse under-currents. As Poor Richard said, "When prosperity was well mounted she let go the bridle; and soon came tumbling out of the saddle."

I make bold to say that there is evidence of treacherous under-currents that threaten our standards even to the domestic hearth stone; and if that foundation fails then the stupendous and complex mechanism of production and trade is but

a treadmill or a merry-go-round without enduring purpose.

Politically we have cut many of the moorings so carefully conceived and anchored by the founders and have ceased to be a fully counter-checked Republic.

We continue to complicate our body politic with an ever-increasing flood of ill-considered, restrictive and inapplicable legislation—coupled with fiscal follies that are not even experiments, but repetitions of well authenticated blunders of the past. Warnings are ample; but when speed is the chief consideration guide posts are the least.

During recent years our Federal debt has been decreased and revenues conserved to the relief of Federal taxes; but the public debt of states and municipalities has more than offset the gain; throwing the burden onto that majority class that can least afford to bear it, in increased rents and other immediate living expenses.

We need a consolidated Balance Sheet.

Unsound political finance may float for a while, but not indefinitely, upon a prosperity that grew chiefly from private initiative based on directly opposite policies; just as a lax society may revel for a while, but not indefinitely, in an affluent social structure built under a stricter regime.

We all know when a barn door should be locked.

It would, I believe, be a blessing if we could wipe out the legislative accumulation to make way for fundamental codes in their original and logical form; but the mills grind on. Elihu Root stated some time ago that in five years 60,000 new laws were enacted in the U. S., most of them penally restrictive. Are we, in consequence, a better and more law-abiding people; or are we in effect merely kicking ourselves in the back?

We seem to have forgotten that our national growth arose from a bill of rights, and not a bill of restrictions, under the theory that government is best that practices economy and governs least.

Turning to the question of national resources, that are not inexhaustible, what of denuded timber lands without a full application of known and practical means of restoration? What of mineral deposits withdrawn at a rate Nature cannot replenish, and uneconomically consumed? These deposits are vast, but a population increasing in numbers, and the means of satisfying even its most extravagant tastes, is compounding the consumption rate. What of exhausted agricultural tracts without proper precautions, through rotation and diversity of crops, to revitalize them?

I believe that correction must come through enlightened self-applied action of the people at large, under the guidance of

those who in practical fact represent the Nation.

After all a nation is primarily a great business institution and is strong or weak in proportion to its trade and commerce, that reflect its natural resources and the enterprise of its people. Hence the main national hope lies in its leaders; in agriculture, transportation, manufacture, industries generally, labor of all classes and last, but not least, finance; all acting in mutual, harmonious accord.

Here is the logical crux of the matter—mutual, harmonious accord—which sounds so simple, but isn't. We strive for adjustment through legislation and fail for what seems a most obvious reason. Most of these laws spring from an antagonistic urge of one interest or class against others; engendering bitterness, enterprised economic strife and class conflict. Moreover, being so conceived, the laws generally emerge in a restrictive, rather than a stimulating form.

We are prosperous now because of private initiative and the leadership of practical men, of life-long experience; and such developed or developing weaknesses as there may be must be corrected by such men. There is no other class so competent, so immediately concerned, or that more earnestly champions social betterment. Business, big or little, cannot survive except on the basis of public interest. A prosperous public is its life blood and the breath of its nostrils.

I am sufficiently optimistic—perhaps stubborn—to argue as follows:

History has amply demonstrated that nationally sound practices and ideals cannot be made enduring by fiat or legislation. And yet I refuse to accept the conclusion that the "cycle" is inevitable and that all civilization must fall. They have fallen because they have repeated the errors of their predecessors.

Furthermore, the beginnings at least of corrective action are now in process—still scattered and relatively small, but increasing in scope and force.

One of the leading factors in our national progress has been the tendency in industry to organize associations for mutual conference. Nowhere else in the world may be found so many associations of this character. As a result there has come about a remarkably high degree of standardization in most industries stimulated by Federal co-operation, unique in governmental history. Standardization has brought improved products at lower costs through mass production with high wage scales; giving us an accelerated domestic consumption and a marked advantage in world competition.

This Association movement has grown to an extent, in fact, that calls for study; lest it become itself unduly complicated. There appears to be need of simplification of association work to effect economies

in the matter of conventions, over-lapping of functions and conflicting activities.

Among these associated groups the American Construction Council is notable in some respects. Construction is the measure of material growth. The substance of the nation or community is not represented chiefly by population, or by wealth in terms of money, but by its tangible structures.

All branches of construction come within the scope of your functions, as I understand them. I know of no trade or industrial nucleus that involves such a wide range of activity as this conference with representatives of architects; engineers; manufacturers of materials and equipment; builders and contractors; financial agencies, labor groups, public utility and political bodies—Federal, State and Municipal. In most of these groups are separate organizations working for betterment in their respective fields and this Council was conceived, I take it, to be the means of adapting their policies one to another and providing opportunity for mutual adjustment in the best public interest. This body might in fact lead to an even broader clearing house of association activities; as every material accomplishment involves construction in one form or another.

Then there could periodically meet in voluntary congress representatives of all the separately organized elements of the nation to crystalize their ideals; free from any hope of reward or fear of rebuke from the ballot box.

So might the real leaders become the *de facto* government ruling by precept rather than a penal code; working together towards higher standards than any written laws could presume to embody or enforce.

Then legislative mills might rust for lack of grist from clashing interests; but that need cause us no regrets. Bureaus might wither and dry up for lack of inquisitorial functions to perform; but that also we might endure with fortitude.

So much for Utopian visions.

The problem before us is this—Can we change the sequence of the cycle and pass from Construction to Reconstruction without going through consuming fires of Destruction?

At least we have made a start and may assume that we are shaping an era of Reconstruction as fundamentally important as the very foundations of the nation—an era during which we and the immediate following generations may deserve, from those who inhabit the land a hundred and fifty years hence, a gratitude and reverence as great as we now render to the pioneers of '76. Here is a trusteeship and an obligation.

But all this will not come to pass without sacrifice and sustained effort of far-seeing men to mould a public spirit above

and beyond the immediate interests of current business.

I do not suggest that this Council should address itself to applying all, embracing panaceas, but its activities affect the main root of material things; and the habits and customs of the people may be more effectively influenced through their material welfare than by any threatening arm of the law, or persuasive reasoning and appeals to idealism. Indeed an idealism that does not ultimately square with material welfare has a flaw in it.

My thought is that the American Construction Council because of its broadly chosen sphere of influence might become the laboratory from which would emerge a simplified nucleus of joint activities; drawing into coordinated action all principal economic, and perhaps, social forces, that together could establish another national record.

Man is endowed by nature—most cruelly it appears—with tastes and tendencies that generally run counter to Her inflexible laws. So we find that human strength and real advancement individually or collectively, come only with self-discipline and self-restraint in the Present, heedful of the Past, that, through the operation of cause and effect has disclosed the laws; and ever mindful of the Future.

We have at our command a great Ship of State with the compass of the Past to guide us. We have fabulous—well nigh unlimited means. Have we the wisdom and courage to steer by the compass against popular currents?

We are better equipped than any earlier civilization or generation and not only have we means in abundance, but our rapid advance to national leadership and wealth has come within a half century—the period of industrial development and in large measure the very men are with us in active life who built the structure and know the ways of strength. Can we as a nation take ourselves in hand and by mass volition correct our faults and weaknesses while still in the sunshine of prosperity?

Such a performance is without precedent in history and if we should prove equal to the task all other national records would pale beside it.

Is it too much to hope that an outstanding influence toward such a consummation may be the destiny of The American Construction Council?

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

**You Can Pour Concrete
In Freezing Weather When
You Use "ANTI-HYDRO"**

Lehn & Fink Building, Bloomfield, N. J. Buchman & Kahn, Archts. Chas. R. Hedden Co., Contrs.

This entire building was constructed between November and February
with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mix-
tures to 17 degrees below the freezing point of water, making it possible
to continue concreting, cementing and masonry work during freezing
weather and finish your contracts on time with prompt payments for
completed work.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also
permanently hardens and waterproofs concrete all in one operation.
It mixes readily with the gauging water without the aid of skilled labor.
During 23 years of continuous use "ANTI-HYDRO" has never failed to
live up to the claims made for it. Satisfactory results are guaranteed.
Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Route 30, Sec. 6 (Revision of 1927), Packer's Island to Allerton, Hunterdon County. Lowest bidders: I. B. Miller, Inc., Teaneck, N. J., \$400,737.40; Union Paving Co., 123 South Twenty-first street, Philadelphia, \$409,043.72.

New Jersey Contracts Awarded

Nurses' Home, New Jersey Hospital for Insane, Trenton, N. J. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, Trenton, N. J. Brick, reinforced concrete, steel, 2½ stories and basement, 155x52 feet, Bangor slate roof, cement and yellow pine floors (plumbing, heating and electric separate), metal lath, tile and marble, steel sash, kalamein doors, bond, iron stairs, ornamental iron, cinder concrete block, incinerators, waterproofing. Contract awarded General Cont. & Const. Co., First National Bank Building, Trenton, N. J., \$108,000. Plumbing: J. Miller Heidweiler, 526 Hamilton street, Trenton, N. J., \$8,772. Heating: Fred Wackenhut 2416 Frankford avenue, Philadelphia, \$9,315. Electric: Jackson Electric Co., Forst Richey Building, Trenton, N. J., \$5,579.

Residence, Haddonfield, N. J. Architects, Bailey & Bassett, 421 Chestnut street, Philadelphia. Owner, R. W. Lippincott, care of architect. Brick, cut stone, steel, 2½ stories and basement, 35x25 feet, 16x20 feet, shingle roof, oak and pine floors, plumbing, ornamental iron work, bond, metal lath, tile work, hot water heat. Contract awarded M. W. Young, 2037 North Sixty-third street, Philadelphia.

Surf Bath House and Store, Boardwalk, Atlantic City, N. J. Architect, A. L. Brooks, Humphreys Building, Atlantic City, N. J. Owner, name withheld. Brick, steel, concrete, 1 story, 50x390 feet, slag roof, wood floors, electric light, steel sash and skylights. Contract awarded Raymond Wochner, Venice Park, Atlantic City, N. J.

Store Building (add. and alts.), 2406 Federal street, Camden, N. J., \$7,000. Architect,

A. B. Gill, 328 Market street, Camden, N. J. Owner, Fred Spuhler, 3200 Federal street, Camden, N. J. Brick, 2 stories, 20x20 feet, asphalt roof, hot water heat, electric light. Contract awarded William G. Mummaw, 301 Morse street, Camden, N. J.

Store Building (alts. and add.), 1429 Haddon avenue, Camden, N. J., \$5,300. Architect, private plans. Owner, Harry K. Pape, 1429 Haddon avenue, Camden, N. J. Brick 2 stories, 24x19 feet, slag roof, hot water heat, electric light. Contract awarded Benjamin F. Harvey, 1109 Empire avenue, Camden, N. J.

BRIGHT AND GAY COLORS TO BE USED ON BUILDINGS OF FUTURE

Buildings of the future will be different in appearance from any existing today. This will be true of their color, at least, if representative architects, artists, builders and material men are correct in their opinions.

Old-fashioned, conventional shades, with their more or less drab monotony, will be outnumbered by varied and brilliant hues in terra cotta and similar materials—in the daytime, clear and beautiful, and at night sparkling like jewels in the flow of myriad lights.

Such is the scene suggested by paintings exhibited at the recent Architectural Allied Arts Exposition. Architects who foresee the use of color in building, to a greater or less degree, include Ely Jacques Kahn, Fredric C. Hiron, John Sloan, Joseph Urban, designer of the new Ziegfeld Theatre, and now engaged as one of the architects for the new Metropolitan Opera House, and Raymond Hood, designer of the American Radiator Bldg., and the Chicago Tribune Tower.

With a large group of authorities agreeing that the buildings of the future will be of the colored type, the first pure example has still to be erected. In modified forms, it is true, there are a number of illustrations today. The Radiator Building is black, with a golden top. Many buildings of conventional shades are decorated or capped with brighter colors. Many white buildings are illuminated with soft lights at night. But there is none in which solid shades of the "new" colors are used as frankly and unrestrainedly as it is declared they will be used.

The delay is attributed to hesitancy of property owners to risk anything not done before. When the first such building is completed, demonstrating its beauty, it will be followed by scores of others, it is predicted.

Many architects already have more or less definite ideas and plans for such buildings, and are awaiting only the word of property owners and builders to go ahead. Manufacturers of terra cotta and similar materials which can be produced in the proper colors are prepared to supply the necessary facings.—*Building Industry.*

HOOVER SEES WINTER BUILDING AS BOON TO ALL INDUSTRY

Labor As Well as Capital Benefited By Elimination of Seasonal Fluctuations

The increasing practice of American industry in general and the building trades in particular to eliminate the traditional "winter slump" is noted by Herbert Hoover in his annual report as Secretary of Commerce, just made public.

While a large number of agencies continue to abide by the exploded theory that construction in winter is both inadvisable and prohibitive, there is a definite trend toward utilization of the winter months for construction of every type, it is stated.

"The seasonal fluctuations in building and other construction operations," says Mr. Hoover, "have been decidedly less marked in the last three or four years than previously. Contractors, the owners of buildings and other groups connected with construction have put forth serious efforts to keep building activity more nearly even throughout the year, and have had the active co-operation of this department in achieving tangible results.

"As a consequence, building-trades workers have enjoyed more stable employment, and at the same time the costs of construction to the public have undoubtedly been lower than would otherwise have been possible."

Economists point out that winter building means the advantage of earlier completion and enjoyment of private homes, a reduction of overhead for contractors, earlier profits for builders of apartments and hotels, uninterrupted programs of civic and other governmental improvement projects and benefits to labor in constant employment as well as to capital in the circulation of otherwise idle money.

THE NEW ECONOMICAL WAY TO BUY BUILDING

By G. SZMAK, *Economist*

An economical purchase is the result of positively knowing why, how and what to buy. To replace the wasteful and uncertain methods of buying building, which do not assure the buyer quantity, quality

or economical price, there has developed during the past fifteen years a new and efficient service. The buyer may now receive a positive record of his purchase, showing the exact quantity and quality of materials and workmanship, in uniform units of measurement. With the aid of this record the buyer can determine the exact cost of his purchase based on the unit prices bid for the work by contractors. This system gives the buyer absolute assurance without having to take the word of anyone for the fairness, accuracy

and economy of his purchase. The record or instrument of purchase known as a construction survey, shows the exact quantity and quality of materials and labor required to erect the building.

Construction surveys are now recommended by every up-to-date architect and builder because it helps them to give the buyer better service at a cheaper price. The construction survey is a measurement and tabulation prepared from the architect's plans and specifications just before the drawings are submitted to contractors for bids. This survey accompanies the plans and specifications and forms an exact basis for the contractor's bids without possible variation or misinterpretation, which always reflect to the disadvantage of the buyer because it is only reasonable for contractors to protect themselves against possible loss. It always costs a good deal of money not to state or know the facts, whether you are buying a suit or a building.

The buyer is now in position to use the facts merely by having the architect or engineer provide a professional construction survey with the plans and specifications. The cost of the survey is known to the buyer in advance and it may be included in the contract of the builder. Therefore it not be a burden of expense to the buyer any more than under

the old system. In fact, it costs less than before, because it does not involve a wasteful duplication of surveys. Under the old system, a survey of some sort is prepared by each contractor, sub-contractor and dealer bidding on the work. However, the buyer does not receive the direct benefit of these surveys.

The cost of a professional survey is only paid for once, whereas under the old system the expense of surveying is as manifold as there are contractors, sub-contractors and dealers bidding on the materials and labor required for the building. Under the new system there is only one professional survey prepared to serve all purposes of the owner, architect, contractor, sub-contractors and dealers regardless of the number of bidders on the work. This means the elimination of one or two hundred surveys on jobs of any importance, which is unquestionably a great saving to the buyer.

Just as land surveyors assure a correct purchase of property through their survey, the construction surveyor likewise assures the buyer on the correct purchase of construction in every respect. The saving derived through using a professional survey will safely average as high as 10%, plus the increased value of materials and workmanship, which are added to the life of your building by stating and knowing the facts concerning your purchase.

There are professional construction surveyors located in nearly all of the larger cities who can capably serve your architect in the preparation of surveys and on all matters preliminary to building contracts. Don't neglect to have your architect provide you with a construction survey and thus you will be positively assured of buying an economical building.

NEW CUT CAST STONE CORPORATION FORMED

The Penn-Jersey Cut Cast Stone Company has incorporated for \$125,000. Their main office is located at 612 N. Broad Street, Woodbury, New Jersey, and their plant where they are now operating is located at 344 Haddon Avenue, Westmont, New Jersey. This plant was formerly operated by the Architectural Cut Cast Stone Company.

Walter G. Jones, who is a widely-

known business man, is President. Charles Sanzare, is Vice-President. He was formerly connected with Thomas Riley (Stone Contractors), of Philadelphia, as superintendent. Lawrence J. Darms, Real Estate Operator of Woodbury, New Jersey, is Secretary and Treasurer. Umberto A. Gasparri, who has in the past few years had charge of the plants of the Vineland Architectural Cut Cast Stone Works, the New Jersey Art Stone Company and the Architectural Cut Cast Stone Company, is General Manager of the plant at Westmont. He is widely known in this field and an expert in his line.

Adv. of this company may be found in this issue and the members of the company will be pleased to forward samples or give expert advice on anything pertaining to architectural stone.

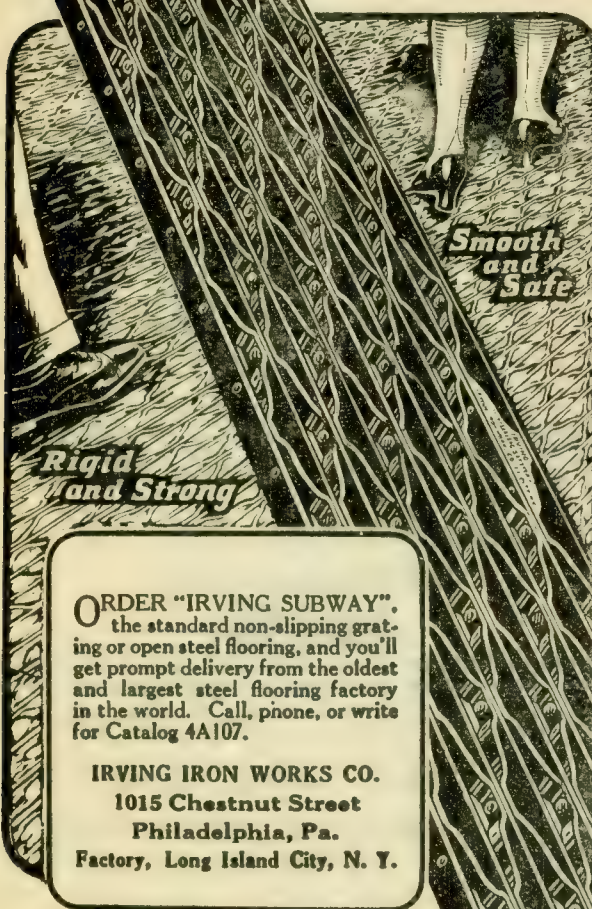

"SIZE, COST, ADVANTAGE AND SERVICE OF AN ARCHITECT"

By JAMES H. DUTHIE, of Fox, Duthie & Foose, Architects

In a later talk we will discuss in detail the questions of size, cost, good planning and good design. Suffice it to say at this time that before undertaking to build a home we should determine very definitely how much we can afford to pay for it. Its size will, to a large extent, be governed by the size of our family, our mode of living, and our ability to pay.

In order to get the most out of the specific discussion of planning, designing, size and cost which will come in a later talk, we will first consider the function of an architect and what relation should exist between architect and client in order to produce the best result. The service which an architect renders and the advantages of employing an architect for the small house are much better understood and appreciated today than they were a few years ago, thanks to those architects who have pioneered in the small house field and also to the educational efforts of the popular magazines, newspapers and trade journals. An architectural consciousness is being born in the public mind and the layman is gaining the true conception of the architect's service. Only a short time ago the architect was regarded by the majority of the people as "the man who draws plans" or worse yet,

"the man who makes blue-prints." Today such an ignorant point of view is the exception; almost everyone realizes the architect's function is that of an expert. Native talent developed by special education and by practical experience create in any field expert ability. The lawyer, the surgeon, the scientist, the architect, the sculptor, each in their field, have a special knowledge and skill and it is this knowledge and skill applied to the solution of your own problem of planning and designing a home that you buy when you employ an architect. The various processes of sketching, drafting, specifying and supervising are but the means to an end, the tools by which the creative ability and the expert judgment of the architect are translated into buildings which are beautiful and practical.

Almost everyone today is intelligent enough to know that when they employ an architect they are buying his thought, his judgment, his creative talent and they go to him with an open mind eager to obtain the best result which he can produce. How different this is from the old point of view, "I want you to draw me a house just like John Smith's" or "I've got this house all planned and designed, I just want you to draw it up for me." Such stupidity is rare today, although it was quite common a few years ago. This new intelligence awakening in the public consciousness regarding the architect and his service will exert a far-reaching influence for good upon the architecture of our homes. And why should not the home, the smallest home as well as the largest, have the rank of architecture? Why should architecture be confined to a few monumental and commercial structures and to the homes of the wealthy while the vast majority of construction which consists of the homes of the average family remains unspeakably ugly and crude.

Now I do not, at all, mean to convey the idea that you should only tell your architect that you want him to plan and design a house and keep silent about your

likes and dislikes. By all means tell your architect how much you can afford to pay for a house, how many rooms you need, your manner of living and what things appeal to your taste. If the simplicity and symmetry of the Colonial style strike a sympathetic chord in your nature, tell him so; if the picturesque charm of the half-timbered English or French cottage intrigues you tell your architect. Tell him fully of your needs, tastes and ideals in order that he may express your personality in your home, but beyond this type of information do not trespass, if you wish to become the possessor of a home which ranks as architecture because of those qualities of distinction and charm with which your architect can endow it; a home whose beauty stirs the admiration of the passerby and confers the mark of good taste upon those who dwell within.—*Building Industry.*

IN THE REALM OF CEILINGS

By ZOE A. BATTU, in the "Pacific Coast Architect"

Perhaps you have noticed it—that there is something psychologically peculiar about ceilings. We may enter a room luxuriantly carpeted and richly furnished, whose walls are adorned with costly hangings, but instinctively our eyes first sweep to the ceiling, to rest there for a fleeting instant. We enter a business house, store or bank—its ceiling in nine cases out of ten is the first thing that rivets our attention. We seek to find a solution to our mental perplexities in the ceiling. We cannot escape from ceilings; we are always vaguely aware of their presence, and though we may never consciously analyze the nature of our reactions to certain ceilings, they are, nevertheless, satisfying or irritating to our sensibilities, as the case may be. Why?

The student of psychology and philosophy could no doubt supply any number of plausible reasons for our instinctive interest in ceilings. But we shall not

concern ourselves greatly with any of these, merely accepting the fact of our inherent attraction to ceilings, and considering what essentials the architect may bring to them to render them esthetically expressive and beautiful.

Thinking back upon it, the ceiling in the great cathedrals and palaces of Europe; the ceilings in those homes, hotels, railroad stations, public and business buildings at home and abroad that have impressed themselves upon our memories have done so because they were expressive. Somehow they caught, held and embodied the dominating idea, the spirit of the building and its purpose. They were the epitome, the dramatic climax, of the story of the motives which the structure served—motives of reverence, worship, comfort, relaxation, amusement, beauty, finance, commercialism.

Expressiveness, then, appears as the major element in ceiling design, and nowhere is this better exemplified than in bank architecture. A score of years ago the financial house sought to impress the public with a sense of its remote and impregnable strength; to inspire almost fear and trembling. The ceilings of that banking era were lofty, of cold, lifeless material in restrained formal design. But now the world of finance comes down to the level of the street, employing all the sales arts of the market place. More and more are the ceilings in banking houses being touched with bright, gay colors and fanciful designs; unusual materials are being used and illumination employed that gives illusive vagaries of light and shade. All this is expressive of the fact

that banking and finance are talking in terms that every other line of business employs, and architecture is one of their most eloquent mediums.

In the effort to achieve expressiveness in ceilings, we see here and there, in buildings of every kind, size and purpose, that this quality is realized without any intelligent regard for relationships. That is, effects secured which are clever and original in themselves, but which have no actula or symbolical connection with the room and the building. The ceiling in such a case has the rather startling and disconcerting effect of a suspended mass without visible means of suspension.

So the architect, building owner or home builder, with high enthusiasm for a ceiling that will be quite different from anything that has been done before in material, design and ornamentation, will do well to pause and consider whether the proposed material and treatment will be a logical continuation of the essentials of the structure, or merely the injection of a diverse and alien element. This is not a plea against a spirit of free experiment in ceilings, or a condemnation of the use of materials differing from those used in the main masses of the building.

Far from that! The ceilings in our homes have so universally been cut and dried areas of plane surfaces that any architect who will take the time to consider how he can give them vitality and interest, through experimenting with color, texture, design, contrasting materials, lighting, this, that or the other device his imagination may suggest, will surely reap a reward not only in appreciative clients, but in the satisfaction of having made noteworthy contribution to American home architecture.

In the public and business building field the professional and lay mind generally appears more alive to the possibili-

ties of ceilings. This is reflected in the fact that in the noteworthy hotels, banks, public utility buildings, theatres, club-houses, office buildings and the like, constructed within the past few years, the architects with but occasional exceptions have wrought ceiling work of exceptional originality in conception and fine craftsmanship in execution. As a matter of fact, one or two of these jobs have ceiling work which has few equals for its rich imaginativeness, its fine harmonization of theme and materials with those of the building generally and perfection of execution. In this class of work, at least, we have certainly become "ceiling conscious," and the whole trend of effort in this direction indicates a contribution peculiarly creative, beautiful and virile to the architecture of the country.

ART IN ARCHITECTURE

By V. OGLOU, Designer

There is always a great deal of controversy about the eternal question of art in architecture and the amount of effort and money that should be expended for it to achieve a successful building.

On one side, the so-called practical group tolerates art only for what material gains it can bring them, begrudges its existence, recognizes no standards, makes no effort along these lines. On the other side, the so-called artistic group retaliates in the same fashion, setting only a standard of artistic expression, sometimes at the expense of the owner and investor. The result is a very sad lack of co-operation, a tremendous waste of material, money and energy, and a very unsatisfactory condition. And yet it is only a lack of good will that often separates the two groups from a co-operative understanding and achievement in the line of building and architecture.

Artistic expression is not an affectation or an incidental occurrence, but it is an integral part of our emotional life. As such, it has its origin far back in the prehistoric age when the human brain was still in its infancy. From these first efforts of the caveman and up to the present time we have many documents telling of that phase of our life which is called artistic expression.

Art has expressed itself through many channels, but one of the most important, the one that often combines all forms of it for one purpose, was the art of building or architecture. The desire for decoration and embellishment was especially strong in buildings where the ruling emotion of the day was to be expressed by the people in it.

The civic pride of ancient Rome expressed itself in beautiful public buildings, the great religions of the middle ages expressed themselves in magnificent places of worship, the love for luxury, wealth and power expressed itself in the palaces of Europe and the great homes of America. And all throughout the years art went always hand in hand with building, changing its phases as the world ideas changed, but always remaining there in some form or another.

This day and age, although different in many respects from the past generations, has retained all the fundamental emotions of the human being, and the desire for artistic expression is just as strong today as it was a thousand years ago.

Now there is a great deal of argument as to what are the standards of art in architecture and the general opinion is that art is nothing but feeling, and anybody who feels is an artist, and everybody has the right to feel about it as they please. It is true that artistic expression is of a highly individualistic nature, but to reject completely the existence of all

standards in art is just as illogical as to think that a man can build a locomotive on inspiration alone.

The question comes up as to how shall we achieve artistry in building, what reason is there to do it, and what standards shall we assume? As to the standards, these are no better than those of education, ability and experience, and if we follow along these lines we will achieve better results than in any other way. It is essential, however, to look for all three, and especially for the first two qualifications, because they form the foundation on which every successful enterprise is based.

The good reason for a permanently artistic and satisfactory architectural design lies not only in the pleasant emotional reaction that is derived from it (which in itself is of great value), but also in a financial stability. The house poorly designed quickly depreciates, not only in material, but also in looks.

The best illustration of this example is the fact that when a loan firm was called to make an appraisal for a loan on a very well built house, but of a very mediocre type of architecture, the appraiser made the following statement: "Of course, the house is a fine house, but you know it has no architecture and will be hard to sell."

It is hard to assume that the man had the correct knowledge of taste; however, it is logical to assume that if the house was designed right, there would be no objections or questioning as to its architectural merits.

And as to the amount of money to be expended on a building to create a satisfactory artistic effect, this is the answer: "It costs no more to make the building a work of art."—*East Bay Builder*.

EFFLORESCENCE ON BRICK WALL

Since the days of the third Napoleon, the problems of efflorescence on brick walls has been under consideration, and for a long time, as Mark Twain said of the weather, "Everybody talked about it, but nobody did anything about it." Later the chief activity seems to have consisted of taking sides in a controversy as to whether the brick itself or the mortar used was to blame.

As a matter of fact, the materials causing efflorescence may occur in the mortar, in the mortar color, in anti-freezing mixtures, in the soil, in water, in concrete used for foundations, floors, steps, coping, caps, sills, etc., in the soot that accumulates on foofs and possibly to a limited extent, in the brick itself. Backing up brick and tile made of other materials than burned clay are a prolific source of efflorescence.

The materials causing efflorescence may be any one or more of the following: sulphates, chlorides, carbonates and nitrates of calcium, sodium potassium, magnesium and iron and others, no doubt. But whatever the material the *presence* and *evaporation of moisture* is an essential factor.

Development in the art of brickmaking is such that there is little opportunity for efflorescence to develop from within the brick itself. In the first place, there is careful selection of raw materials to eliminate harmful elements and every effort is made to prevent their intrusion. If necessary, chemicals are introduced to convert soluble materials into insoluble forms. Finally burning is carried to such an extent that fusion of any harmful ingredients present results.

It is equally important that the same care and precaution be used in the fabrication of the completed wall and in its subsequent treatment. It must be borne in mind that ordinary mortar is made up largely of lime, with more or less magnesium, and that the more soluble salts may be introduced with the sand and mixing water. Red mortar color, particularly, contains iron sulphate. Portland cement concrete and mortar are in a state of continual change and in the presence of moisture, free lime is formed. Soil and soil waters contain lime and other salts. In the presence of moisture and of these deleterious materials may be brought to the wall surface by capillary movement and be deposited thereon as the result of evaporation.

Water must be employed in the fabrication of concrete and in the preparation of all kinds of mortar. A moderate amount of initial efflorescence, therefore, well may be expected, but is of little concern. Subsequent appearance of efflorescence may occur also if proper methods of design and construction have not been followed or if improper practices are involved. Such subsequent appearance is of more importance and may become more or less permanent.

Much of the difficulty may be avoided if due precautions are used. Especial care should be exercised in the selection of materials, particularly sand, gravel and water to be used in making mortar or concrete, to make sure that they are as free

as possible from deleterious substances.

Attention should be given also to the arrangement and protection of the various elements of the wall and to subsequent treatment of the wall and its appurtenances.

If concrete foundations are used, a strip of heavy asphaltic roofing should be placed between the foundation and the brick wall.

All concrete sills and caps and coping should be provided with proper drips.

Foundations of all kinds and retaining walls should be water-proofed on the soil side with an approved asphaltic compound.

Portland cement mortar should be used for all walls making contact with the soil or in a position where water from sprays or eaves drips may reach them. Elsewhere, low magnesium mortars are preferable to high magnesium mortars.

Roofs must be designed and constructed so that no water may reach the walls.

Eaves troughs and downspouts must be properly designed and constructed and be kept in repair.

Sprays should not be permitted to play directly against walls, and care should be used in the process of scrubbing porches and steps. In connection with the latter there is danger not only with respect to the water itself, but because of the soap or washing compound used.

Efflorescence mars the appearance of a brick wall and may result in disintegration of the mortar and even the surface of rough texture brick.—*Associated Contractor*.

SOUNDPROOFING OF APARTMENT HOUSES

By V. L. CHRISLER, Associate Physicist,
Bureau of Standards. Technology
Paper No. 337

With the increasing number of apartment houses and office buildings and the consequent concentration of human activities in close proximity, the problem of sound insulation is rapidly becoming one of the first magnitude. In the construction of such buildings increasing attention is being given to the choice of materials and to the type of construction which may be expected to give a satisfactory

degree of sound insulation. Until the last few years there has been but little information available on this subject, but recently several laboratories in this country and abroad have given systematic study to the conditions underlying this problem. Among these laboratories the Bureau of Standards is included.

About four years ago the Bureau of Standards constructed a special building for the purpose of making tests of the acoustic properties of building materials, and since then it has tested a large number of partition walls of the types commonly used in building construction. At the present time attention is being directed to various types of masonry walls and floors. It has been gratifying to find that several associations representing the building trades have considered it worth while to co-operate in this program of experimental work. Such co-operation has been available from the Gypsum Industries (Inc.), the National Lime Association, and the Hollow Building Tile Association.

To form a clear idea of the problem of sound insulation it is necessary to consider how the air vibrations which constitute sound waves are transmitted through a partition wall from one room or space to another.

Sound waves in air consist of alternate compressions and rarefactions, and if there are no holes or cracks in the wall to provide an air path along which the waves can pass directly from one side to the other, the only mode of transmission is by setting the wall itself in vibration. The wall yields a very little to the pressure of each sound wave that strikes it, so that it is thrown into a corresponding state of vibration; and the vibrating wall, in turn, sets the air on the other side in motion, just as the diaphragm of a telephone receiver or of a loudspeaker set up sound waves which are then propagated through the air to the listener's ear.

A solid wall or a smaller panel, such as a wooden door, thus acts like a more or less elastic diaphragm held at the edges, and it is obvious that the less the wall moves back and forth in response to the sound waves falling on one side of it, the fainter will be the sounds set up on the other side. Hence, making the wall stiffer or heavier, or both, makes it a better sound insulator.

The behavior of compound walls containing enclosed air spaces is not quite so simple, and as an important practical case we may consider the common lath-and-plaster partition supported on studs.

Each face of such a wall consists mainly of a series of rather light and flexible panels, held more or less rigidly at their edges by the studs. The two surfaces are separated by an air space except at the studs, where there is a rigid cross connection which ties the two surfaces together

and at these points forces them to move back and forth simultaneously, if at all. Under the alternating pressure impulses of sound waves the studs yield a little and the wall may vibrate as a whole, but each of the more flexible panels may also vibrate separately, its center moving more than its edges, and we may consider what happens to the middle of the panel, disregarding the motion of its edges, for the present.

The surface toward the source of sound is thrown into vibration, and this sets up corresponding sound waves in the dead air space. These throw the second surface into vibration, and so, finally, sound waves are set up in the air on the farther side of the wall. A simpler way to look at it is that the inclosed air acts like an elastic crosstie between the two layers of lath and plaster, but this connection is so weak that the motion of the second surface is very much less than that of the first. The connection is very ineffective, the transmission is low, and the air space is a good insulator.

But if a rigid cross connection is established in the middle of the panel the two surfaces are obliged to move together; and while the first surface is prevented from moving so much, the second moves very much more, and the net result is that the transmission is increased. Thus, while a single strut or crosstie does not constrain the whole panel, the insulating value of the air space is very much reduced.

If we consider any two adjacent panels together, we may evidently regard the intermediate stud as constituting a rigid crosstie in the middle of a double panel. And although the stiffness and weight of the stud prevents the motion from being as great as if the surfaces were merely connected by a light strip of wood not fastened at the ends, measurements made at the Bureau of Standards show that the transmission of sound through a lath-and-plaster wall does occur mainly at the studs and only to a minor extent across the intervening air spaces.

It is evident from the foregoing that cross connections may be very detrimental to the sound insulating value of a lath-and-plaster wall.

Materials which are fairly good heat insulators are often introduced into this air space, as it has generally been claimed that these materials also improve the sound insulation. The effect of such a filler depends on circumstances. The filler may absorb sound, but it also forms a solid connection between the two surfaces, the connection being more or less soft or rigid according to the weight of the wall and this in itself tends to decrease the vibration of the wall as a whole and to improve the insulation.

The net result could not be predicted, but from the results obtained at the Bur-

eau of Standards it appears that such a filling material is of doubtful value. Although it has been a common assumption with builders that good heat-insulating materials are likewise good sound insulators, experiment does not bear this out in all cases. An air space is generally better than a filling material. In the experiments with stud walls at the Bureau of Standards the introduction of various filling materials into the air space between the studs resulted in nearly every case in a slight increase in the transmission of sound.

These measurements illustrate, also, another point—that weight is not the only factor which determines the sound-insulating property of a wall was about the same after the wall was filled as before, although the weight of the wall was about doubled, while for the lighter materials was slightly increased, although the weight had been increased some 50 per cent.

Paul Sabine gives the results of experiments carried out at the Riverbank Laboratories in which he found that either slag or sawdust used as a filler materially reduced the sound insulation of a double partition. The air space in the panels he used was 3 by 8 feet, but the same effect is to be expected in a space of 16 inches by 8 feet, the ordinary dimensions of the section between studs in a partition wall.

In other experiments made at the Bureau of Standards walls were constructed of two solid plaster partitions with an air space occupying the whole area between them. Measurements were taken with the space empty, and also, when this space was loosely filled with hair felt, Celotex, and Cabot's Quilt. It was found that although there was but little difference in the amount of sound transmitted in the four cases the transmission did depend largely upon the manner in which the panels were supported at the edges. For instance, considerably less sound passed through the double panels when they were supported on felt pads than when supported on a piece of wood, which acted as a tie between the two partitions.

(Continued next week.)

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" permanently hardens and waterproofs concrete mixtures in one operation. Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 23 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it for cold weather work. It will save you time and money.
